CONTENTS

PEDIATRICS

LIST OF IMPORTANT TOPICS

GENERAL PEDIATRICS

- Normal growth
- Developmental Milestones : MUST REVISE MULTIPLE TIMES
- Immunisation: latest schedule
- Breast milk: composition, advantages, contraindications, storage
- Severe acute malnutrition, Kwashiorkor, Marasmus
- Inborn errors of metabolism
- Genetic disorders: Down, Turner, Noonan, Edward, Patau, Fragile x syndromes
- Kawasaki disease, henoch schonlein purpura

NEONATALOGY

- Neonatal Reflexes
- NRP Guidelines
- RDS in detail
- Perinatal asphyxia & HIE
- Infant of diabetic mother
- NEC-Bell's Staging
- Jaundice : Causes, Physiological vs pathological, Management

SYSTEMIC PEDIATRICS

- Nephrotic Syndrome, Post streptococcal Gl:omerulonephritis
- Croup, Epiglottitis, LRTI
- Meningitis, hydrocephalus, Neurocutaneous syndromes, Febrile sz, Epilepsy
- Congenital Heart Disease: ASD, VSD, PDA, TOF, TGA, TAPVC
- Diarohea: etiology and management, assessment & treatment of Dehydration
- Congenital hypothyroidism, CAH
- Rickets, Scurvy

LEARNING OBJECTIVES

UNIT 1 GROWTH

- Assessment of growth and growth charts
  - Growth
  - Anthropometric parameters
  - Growth charts
- Normal anthropometric parameters
  - Weight
  - Height
  - Us: Ls ratio
  - Head circumference
  - Brain development
- Short and tall stature
  - Short stature and its classification
  - Mid parenteral height
  - Bone age and its related aspects
  - Tall stature aspects
- Abnormalities of head size and shape
  - Microcephaly and its causes
  - Macrocephaly and its causes
  - Abnormalities of head shape
  - Craniosynostosis
  - fontanelles
- Normal and abnormal dentition
  - normal dentition
  - delayed dentition
  - natal teeth

1 ASSESSMENT OF GROWTH AND GROWTH CHARTS

GROWTH

00:00:15

- Growth: Increase in physical size

Embryo	1st 8 weeks
Fetus	9th week till delivery (birth of baby)
Neonate	1st 28 days of life
Infant	1st year of life
Toddler	1-3 years
Pre school	3-6 years
Adolescent	10-19 years

> **Important Information**
>
> - WHO charts are used now
> - Between 1-5 year: Increase by 0.25 cm/year so it is regarded as age independent anthropometric parameter

IMPORTANT ARTHROPOMETRIC PARAMETERS

00:03:37

- Anthro: Human
- Pometry: Measurement
  1. Weight
  2. Height
  3. Head circumference
  4. Mid arm circumference
  5. Skin fold thickness
  6. Chest circumference
  7. Body Mass Index (BMI)

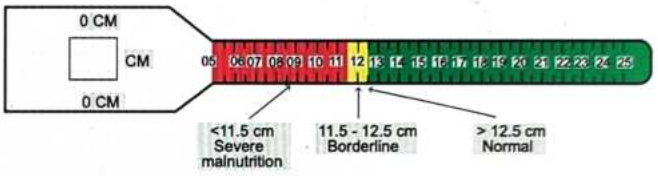
Mid Arm Circumference (MAC)/ Mid Upper Arm Circumference (MUAC)

- It is circumference of the middle point on the arm
- It is the circumference of mid point of distance between acromion process and olecranon process
- While measuring MAC the arm of the child should be hanging loosely by the side.

Normal MAC

- Term Neonate: 9-11 cm
- By end of 1st year: 16 cm
- Tanners chart was used previously to get normal value of mid upper arm circumference (MUAC) at different age groups.

- Device used by health workers to measure MAC: Shakir's Tape, It used for 6 months to 5 years age groups.



Skin fold thickness

- It gives an idea of the amount of subcutaneous fat present in the child.
- Device used to measure it: Harpenden Callipers or Skin fold thickness callipers.
- Areas where skin fold thickness is measured
  - Supra scapular
  - Subscapular
  - Biceps
  - Triceps
- WHO charts are used now to get the normal value of skin fold thickness in various age groups.

- Maximum around 9 months then decreases till 6 years and then increases

Chest Circumference (CC)

- At birth: Head Circumference (HC) > Chest Circumference (CC)
- By 9 months - 1 year: HC = CC
- In a normal child, beyond 1 year of age, CC > HC

Important Information

- If any of the above parameters differ. It indicates underlying Malnutrition

Body Mass Index (BMI)

- Body Mass Index (BMI) = $\frac{\text{Weight (Kg)}}{\text{Height (m}^2\text{)}}$

BMI

- < 5th percentile: Underweight
- > 85th percentile: Overweight
- > 95th percentile: Obesity

GROWTH CHARTS

00:17:43

- Graphical representation of the anthropometric parameters

International Growth Charts

- NCHS Growth Charts (1977)
- CDC Growth Charts (2000)
- WHO Growth Charts (2006)

NCHS: **N**ational **C**enter for **H**ealth **S**tatistics
CDC : **C**enter for **D**isease **C**ontrol & Prevention

WHO Growth Charts 00:20:24

- Preferred growth charts for under-5 children all over the world
- Based on MGRS (Multicentre Growth Reference Study)
- Children from 6 different countries across the world were enrolled
- Countries included in MGRS
  - → **B** - **B**razil
  - → **O** - **O**man
  - → **N** - **N**orway
  - → **G** - **G**hana
  - → **U** - **U**S
  - → **I** - **I**ndia [New Delhi]

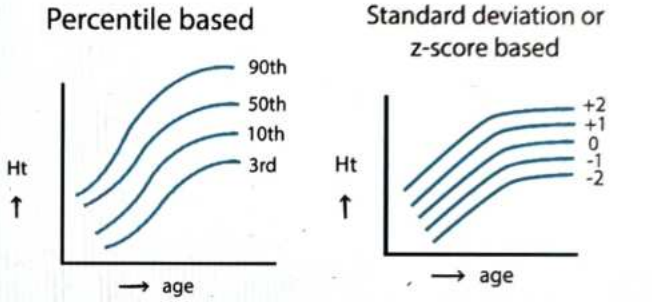
How to remember

- BONGUI

- Enrolled only those babies who are exclusively breast-fed children in 1st few months of life
- Excluded factors like Maternal smoking & Alcohol
- WHO growth charts include charts for
  1. Weight for age
  2. Height for age
  3. Weight for height
  4. Head circumference for age
  5. Mid Arm Circumference for age
  6. BMI for age
  7. Skin fold thickness for Age
  8. Major motor milestones
- Separate charts for boys & girls

2 types of growth charts are available

Percentile based | Standard deviation or Z-score based



Refer Graph 1.1

Refer Graph 1.2

Refer Graph 1.3

Refer Graph 1.4

Indian Growth Charts (Local growth charts)

- Preferred beyond 5 years of age
- Different types of Indian Growth charts
  1. K.N. Agarwal Charts
  2. IAP (Indian Academy of Pediatrics) charts
  3. Khadilkar Charts

Important Information

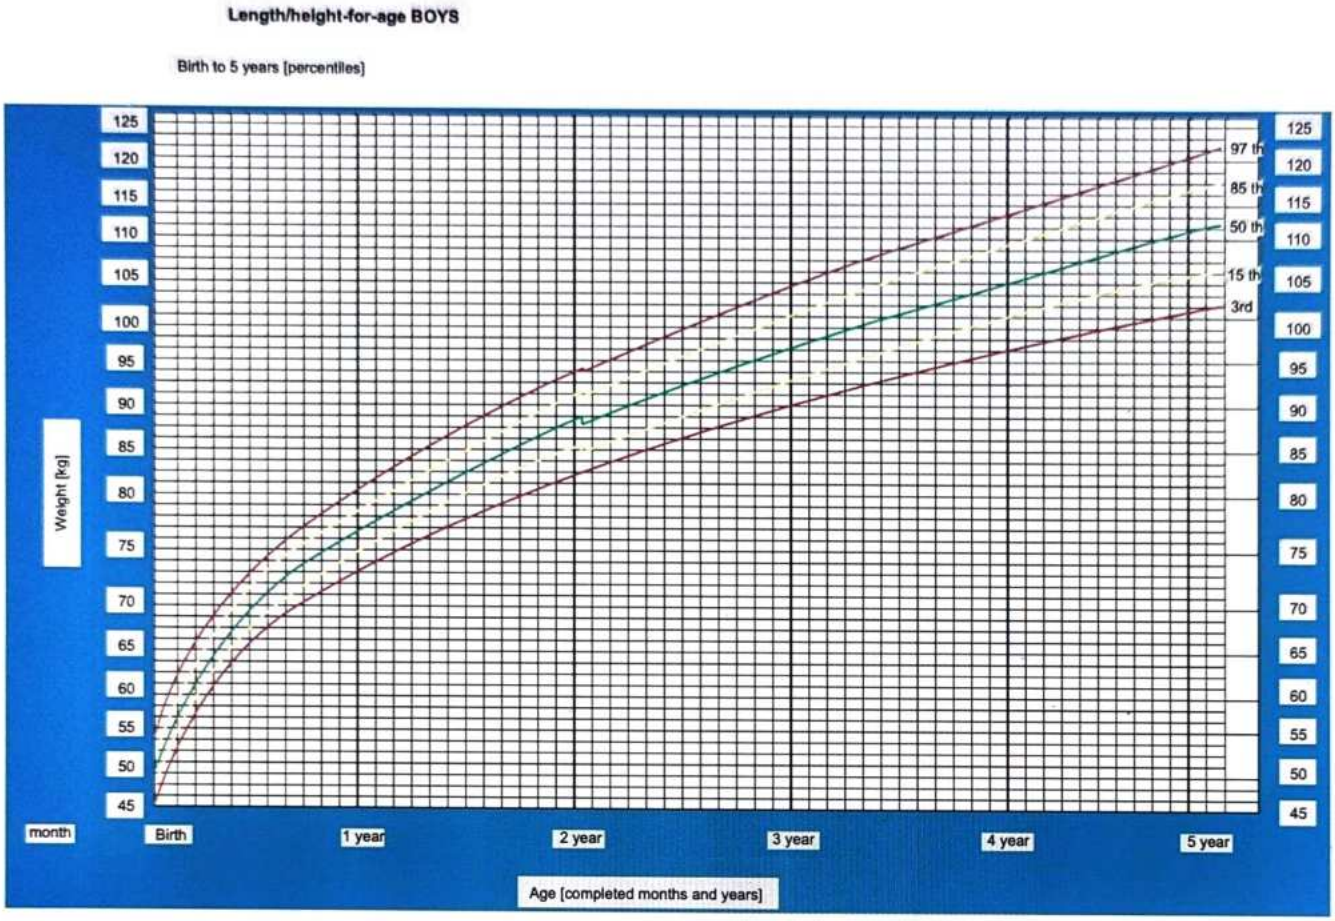
Q. How to assess growth of child?

Ans.

- Decide which anthropometric parameter to use
- Choose appropriate device measure
- Plot on growth chart and compare with normal expected value for that age
- Interpret

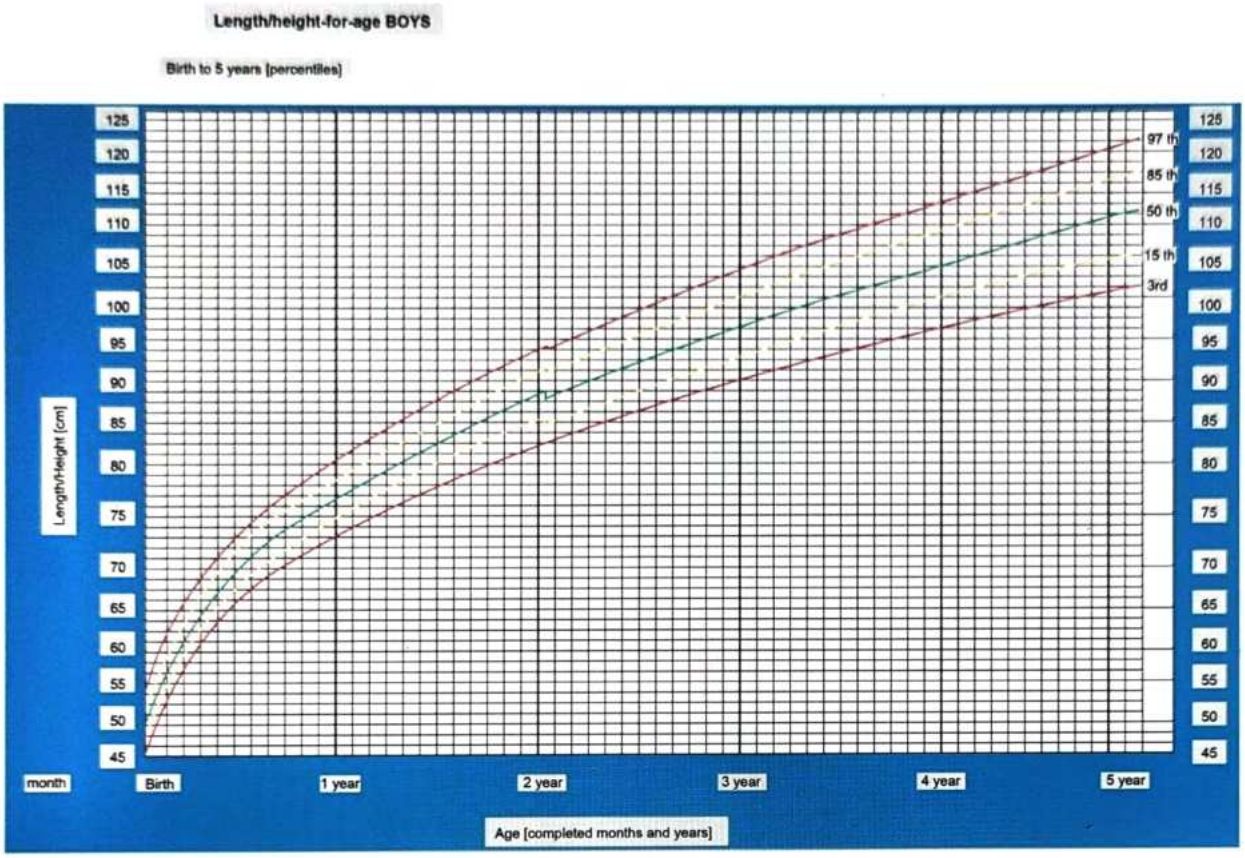
Previous Year's Questions

Q. A 16 month old child, who weights 8 kg has come upto to Anganwadi. Identify the nutrition status of the child and what should be next line of management? Angelman syndrome

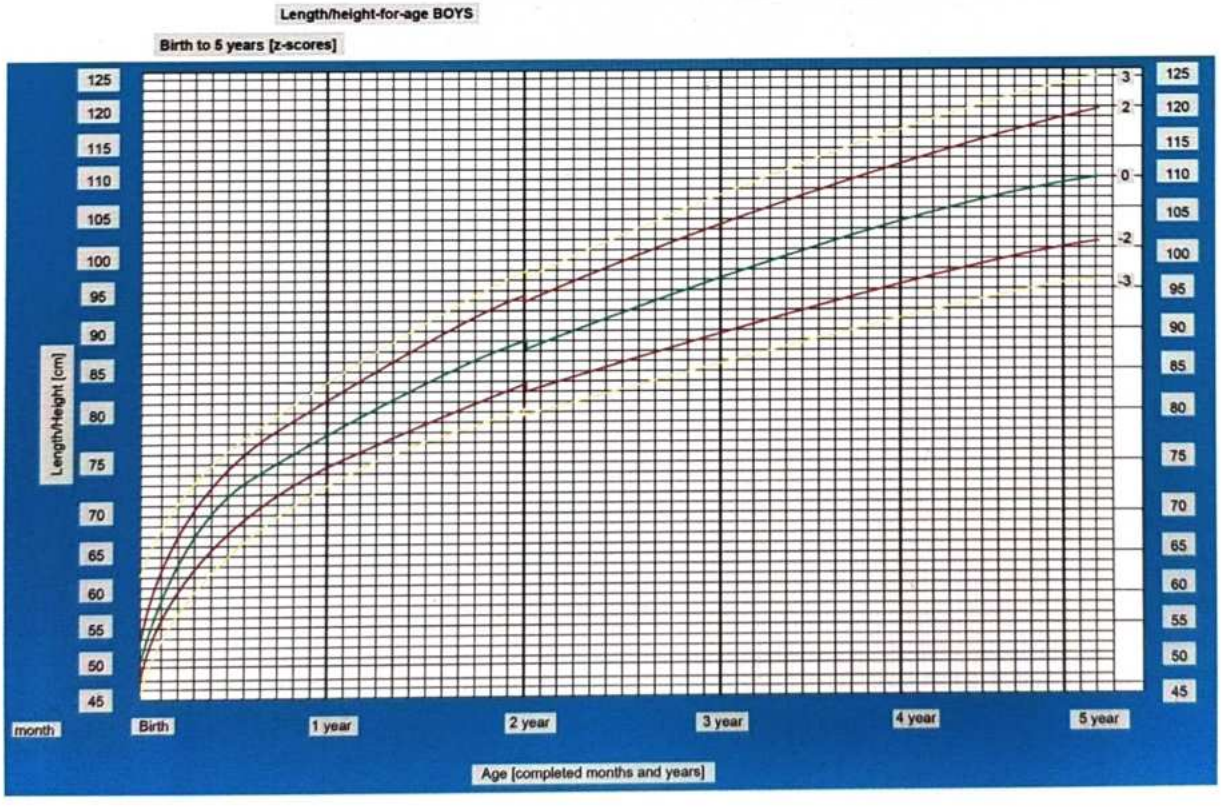


A. Child is healthy, no advise is given
B. Severely malnourished child. Refer for nutritional rehabilitation
C. Moderately malnourished. Advice mother to feed calorie dense food
D. Severely malnourished. Advice mother for home based care.

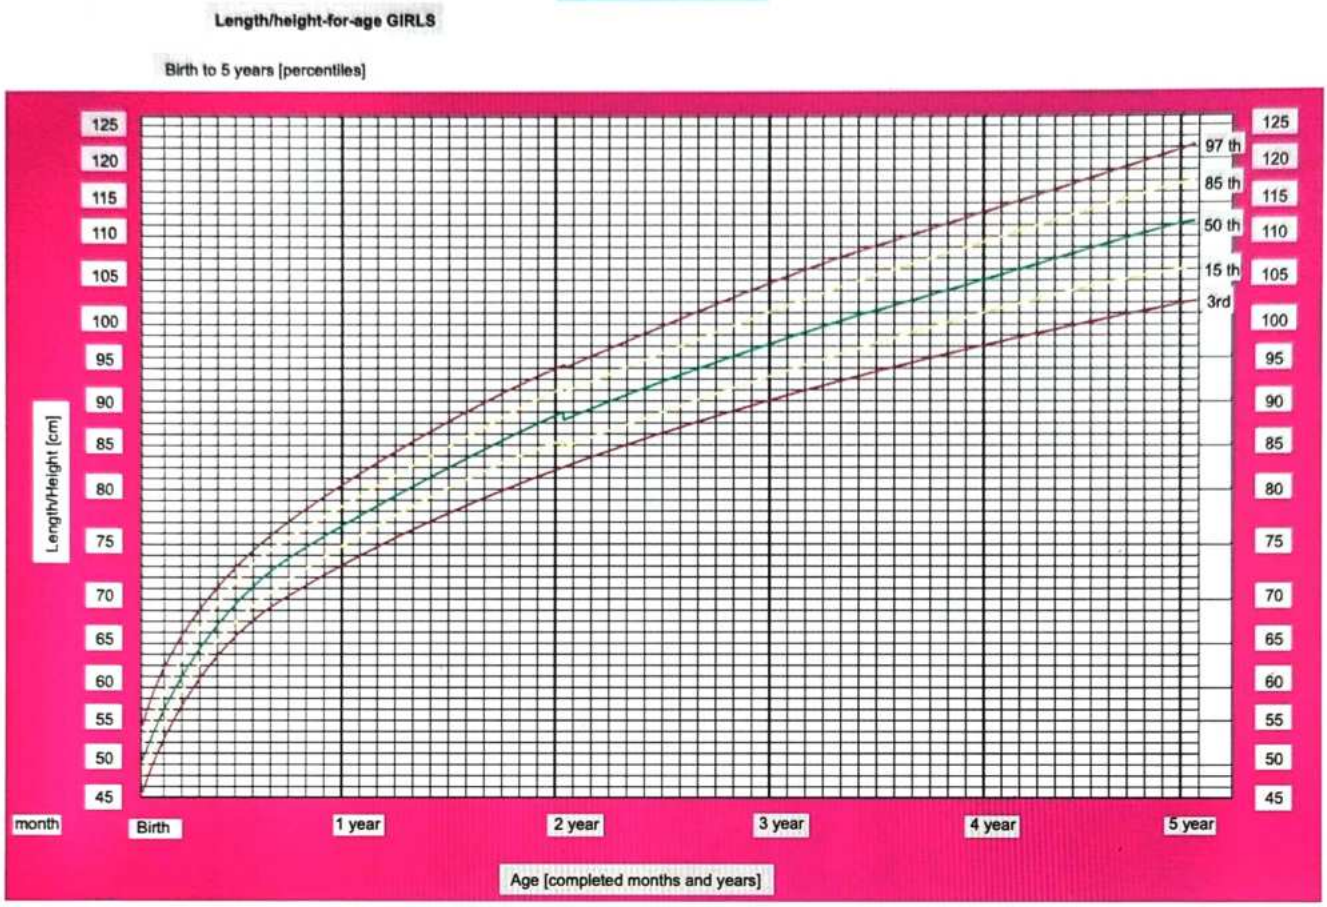
Graph 1.1



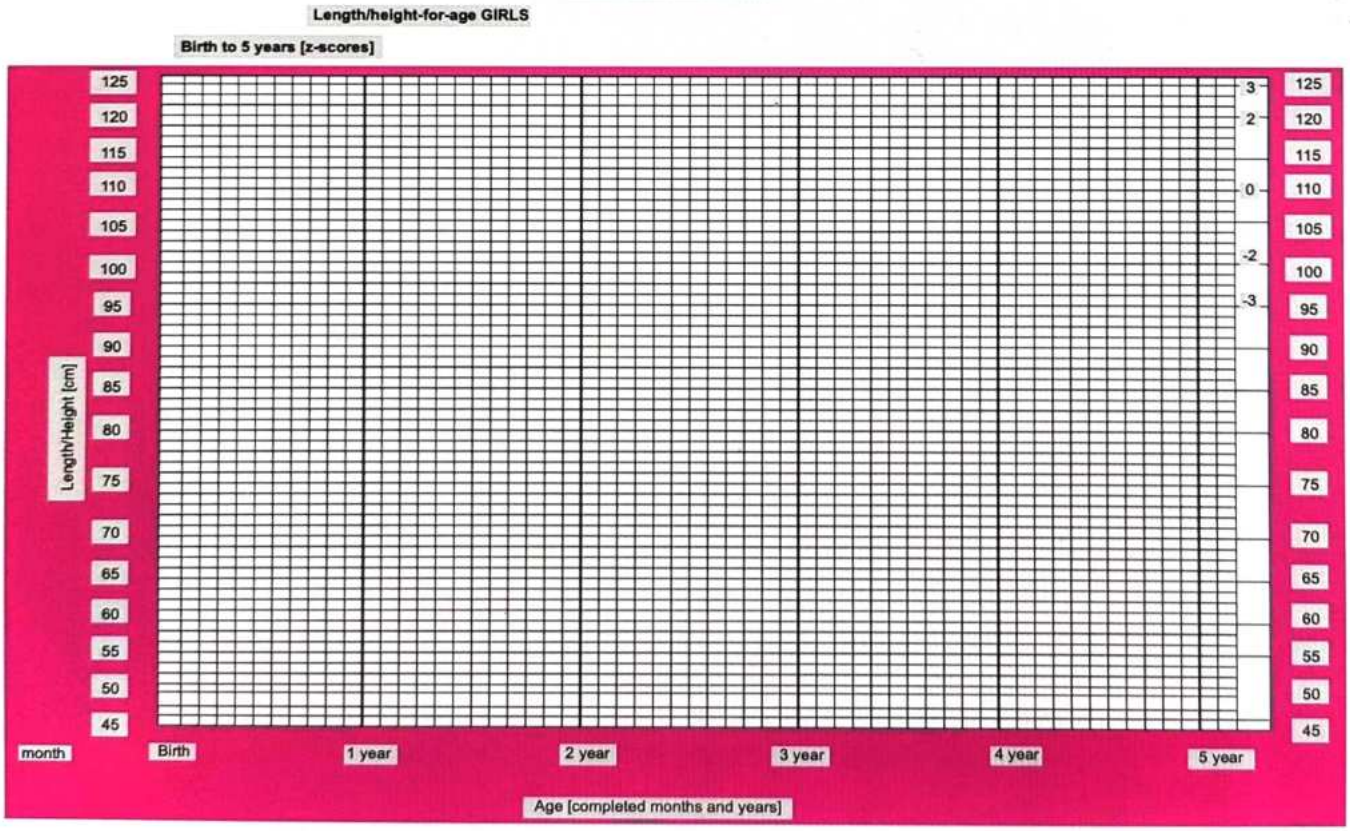
Graph 1.2



Graph 1.3



Graph 1.4



CLINICAL QUESTIONS

Q. Women after returning from her honeymoon, on missing her periods she did UPT and it came out to be positive and for confirmation, she visited her family gynecologist, on examination, it was found that she is pregnant and the embryonic period is already completed. Till what period of intrauterine life is the product of conception considered to be embryonic?

A. 8 weeks
B. 10 weeks
C. 12 weeks
D. 6 weeks

Answer: A

Solution

Embryonic Period	Day of fertilization (14th day post-ovulation) to **8 weeks*** intrauterine life
Fetal period	9 weeks to Birth
Perinatal Period	28 weeks to 7 days of postnatal life
Neonate	1st 28 days of life
Infant	28 days - 1 year
Toddler	1-3 years
Preschool	3-6 years
Adoloscent	10-19 years

Reference: Nelson 20th ed/60

Q. Which of the following are unique features of growth charts 2006 given by WHO based on Multicentre Growth Reference Study (MGRS) that are conducted in 6 countries?

1. It establishes breastfed infant as a normative growth model
2. Sample collected from 6 countries including India
3. Includes new indicators such as skinfold thickness
4. Reiterates children grow similarly across the World

A. Only 1,2,3 is correct
B. Only 1,3,4 is correct
C. Only 2,3,4 is correct
D. All are correct

Answer: D

Solution

WHO growth charts- based upon **MGRS** (Multicentre Growth Reference Study)

- conducted in 6 countries across the world **including India**.
- Babies who were breastfed for at least the first few months of life were included.
- Includes new indicators such as skinfold thickness
- Reiterates children grow similarly across the World

Reference: Ghai 9th ed pg 14

2 NORMAL ANTHROPOMETRIC PARAMETERS

NORMAL ANTHROPOMETRIC PARAMETERS

- Weight
- Height
- Head circumference

WEIGHT

00:00:42

- Device used to measure weight of a child
  - In infants (<10 kg) = Pan type or basket type weighing scale
  - Older children = Platform type weighing scale

Precautions while checking the weight of the baby

1. Child should be in bare minimum clothes. For small baby remove everything including diaper if possible
2. Tare function should be in weighing machine
3. Entire baby should be in pan and let the weight stabilize

Important Information

- **Birth weight of an average in Indian baby: 2.9 Kg.**

How the weight increases with age?

Birth weight	W
At 5 months	2W
At 1 year	3W
At 2 years	4W
At 3 years	5W
At 5 years	6W
At 7 years	7W
At 10 years	10W

- Birth weight doubles itself at 5 month of age,
- Birth weight triple it self by 1 year of age

How much is the weight gain in a baby in different age groups?

0-3 month	30g/day
3-6 month	20g/day
6-9 month	15g/day
9-12 month	12g/day
1-3 year	8g/day

Formula for calculating expected weight of Child

- < 1 year = $\frac{x+9}{2}$, where x: age in months
- 1 - 6 year = 2x + 8, where x: age in years
- 7 - 12 years = $\frac{7x-5}{2}$, where x: age in years

HEIGHT (Length)

00:07:05

- Length measured in < 2 years of age child.
  - Device used to measure length: Infantometer
- Height measured in > 2 years of age child.
  - Device used to measure height: Stadiometer

Infantometer

Important Information

- **Recumbent length (supine length) of child is 0.7-1 cm more than the standing height of child**

Precautions while checking height of baby

1. Remove the footwear
2. Child should stand erect
3. While standing occiput, back of shoulders, buttocks and back of heel should touch the vertical rod behind
4. Remove any cap, hairband, ponytail.

5. Child should look straight in horizontally forward plane
6. In infants ideally 2 persons are required, one will fix the vertical board at the head of child and one will extend the legs of child

Length/ height of child

At birth	50 cm
By 3 months	60 cm
By 9 months	70 cm
By 1 year	75 cm
At 2 years	90 cm
At 4 - 4 ½ years	100 cm

Important Information

- Length of the child ↑ ses by 50% in Ist year
- Maximum growth of a child takes place during 1st year of life followed by Puberty
- Height of a child doubles itself or increases by 100%: 4 – 4½ years

- Calculation of Expected height of child = (6x + 77) cm, x is age in years

Understand with an example

Age of child • 7 years
Height of child • 6 x 7 + 77
• 42 + 77
• 119 cm

Gain in height or length

Age group	Approx gain in length or Height
0 – 3 months	3.5 cm/month
3 – 6 months	2 cm/month
6 – 9 months	1.5 cm/month
9 - 12 months	1.2 cm/month
1 – 3 years	0.8 - 1 cm/month

Previous Year's Questions

Q. A mother of a 5-year-old boy feels that he is too tall for his age & she brought him to hospital for evaluation. O/e his height was 108 cm, arm span of 106 cm, upper segment to lower segment ratio 1.2:1. What would be your advice to the mother?
(JIPMER - DEC - 2019)

A. Order for karyotyping
B. Reassure parents
C. Echocardiography to rule out Marfan syndrome
D. Ophthalmological examination & homocysteine levels

UPPER SEGMENT: LOWER SEGMENT RATIO

00:17:04

- Upper segment: Part of the body above symphysis pubis
- Lower segment: part of the body below symphysis pubis

Age	US : LS ratio
At Birth	1.7 - 1.9 : 1
At 3 years	1.3 : 1
At 7-10 years	1 : 1

ARM SPAN

00:18:46

- Measured on outstretched arms 90 degree to the body from tip of middle finger of one hand to tip of middle finger of other hand.
- Almost equal to height of the child.

Important Information

- Arm span almost equal to Height of child, the difference is less than 3 cm

- At age< 10 years, Arm span is 1 – 2 cm less than height of child
- At age >10 years, Arm span more than height of child
- If difference is more than 3 cm, it is abnormal

HEAD CIRCUMFERENCE/ OCCIPITO FRONTAL CIRCUMFERENCE (OFC)

00:20:50

- It is maximum circumference of head from occiput at back to supraorbital area in front of head
- Measured using Non stretchable measuring tape with 'mm' marking
- To be measured to an accuracy of 0.1 cm

Precautions to be taken while measuring head circumference

1. Don't use tailors tape
2. Use non stretchable tape
3. Use overlapping technique
4. Hair accessories to be removed
5. Measure 3 times and maximum reading is taken as OFC

- At Birth, HC: 33 – 35 cm

Time period	Rate of increase in head circumference
0 - 3 months	2 cm/ month
3 - 6 months	1 cm/ month
6 - 12 months	0.5 cm/ month
1 - 3 years	0.2 cm/ month

Q. If Head Circumference at birth is 35 cm. When will it become 43 cm, if everything remains normal?

At birth	35 cm
1 m	37 cm
2 m	39 cm
3 m	41 cm
4 m	42 cm
5 m	43 cm

- An increase in HC by >2 cm/month is due to some underlying pathology. E.g. Hydrocephalus CNS tumour

BRAIN DEVELOPMENT

	Size of Brain (% of adult size)
At 1 month	36%
At 1 year of age	72%
At 2 years of age	85%

- Maximum brain growth is in 1st & 2nd years of life

CLINICAL QUESTIONS

Q. A female child of 4 years age goes to the aanganwaadi, her caretaker says that she doesn't eat much nor is she that playful unlike other children and also that her height is constant from last 1.5 yr while other children of same age are growing normally. At what rate should the height of children be increasing in age group of 2-10 years?

A. 2 cm/year
B. 4 cm/year
C. 6 cm/year
D. 10 cm/year

Answer: C

Solution

Height Velocity in Children:

Age	Length or height (cm)
Birth	50
6 months	65
1 year	75 (increases by 50%)
2 years	90
3 years	95
4 years	100 (Doubles)

Thereafter, the child gains about 6 cm in height every year, until the age of 12 years.

Reference: O.P Ghai 9th/ed page-14

Q. A female child of 4 years age goes to the aanganwaadi, her caretaker says that she doesn't eat much nor is she that playful unlike other children and also that her height is constant from last 1.5 yr while other children of same age are growing normally. At what rate should the height of children be increasing in age group of 2-10 years?

A. 2 cm/year
B. 4 cm/year
C. 6 cm/year
D. 10 cm/year

Answer: C

Solution

Height Velocity in Children:

Thereafter, the child gains about 6 cm in height every year, until the age of 12 years.

Age	Length or height (cm)
Birth	50
6 months	65
1 year	75 (increases by 50%)
2 years	90
3 years	95
4 years	100 (Doubles)

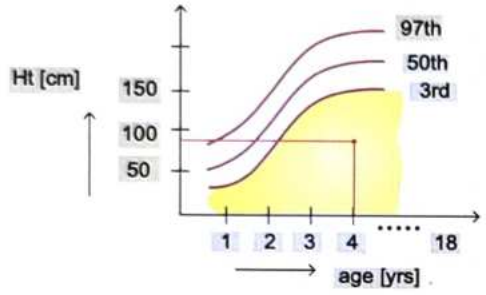
Reference: O.P Ghai 9th/ed page-14

3 SHORT STATURE & TALL STATURE

SHORT STATURE

00:00:22

Definition: Height of child < 3rd percentile or < -2 SD of expected, according to age & sex of child



Classification

00:03:40

- Proportionate Short Stature: US:LS ratio remains normal or unchanged
- Disproportionate Short Stature: US:LS ratio changes

Important Causes of Proportionate Short Stature

00:05:26

1. Normal Variants
2. Intra-Uterine Causes
3. Post-Natal/ Acquired Causes

1. Normal Variants

00:06:45

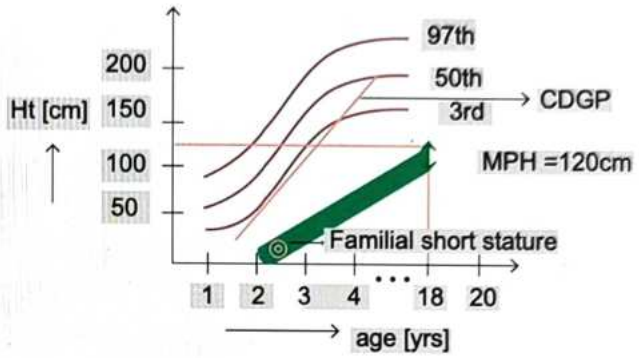
I. Familial Short Stature
II. CDGP (Constitutional Delay in Growth & Puberty)

Familial Short Stature	CDGP
1. Child's height is < 3rd percentile of expected, according to age & sex, but it is normal as per his target height.	1. Child's height is less than expected during childhood, but Final adult height attained is normal
2. Child has normal puberty	2. Child has delayed puberty
3. Family H/O short stature ⊕	3. H/O delayed puberty in parents
4. Bone age = Chronological age	4. Bone Age < Chronological age

Mid Parental Height (MPH)

00:10:25

- Boys: $\frac{FH+MH+13}{2}$ cm
- Girls: $\frac{FH+MH-13}{2}$ cm



Important Information

Bone Age: Preferred X rays for its estimation
- In neonates: X-ray Knees
- Infants: X-ray shoulder
- 1 – 13 years: X-ray left hand & wrist

Condition in which Bone Age < Chronological Age

1. CDGP (Mc cause of short stature during childhood)
2. Congenital hypothyroidism
3. GH deficiency
4. Severe Malnutrition

Important Information

- CDGP is most imp cause of short stature in childhood

2. Intra Uterine Causes

00:23:16

I. IUGR
II. Intrauterine Infections (TORCH)
III. Genetic syndromes
   - Turner syndrome

- Down syndrome
- Seckel syndrome (Bird headed dwarfism)

3. Post Natal/ Acquired Causes 00:24:47

- Severe Long-Standing Malnutrition
- Any Chronic Systemic Disease (chronic kidney disease)
- Any Malabsorption (celiac disease)
- Endocrine Disorders: GH deficiency, Cushing syndrome (Mc cause is latrogenic)
- Psychosocial Dwarfism (maternal deprivation)

GH Deficiency 00:26:57

- US: LS Ratio is normal
- Bone age < Chronological age
- GH Stimulation Test
  - Dynamic test
  - Done by using anyone of
    - → Clonidine
    - → Insulin
    - → Arginine

Rx: Recombinant GH therapy (S/E: Pseudotumor cerebri)

Important Causes of Disproportionate Short Stature 00:29:52

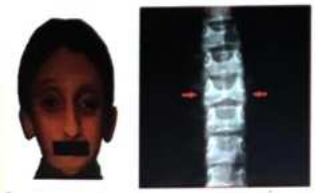
Refer Table 3.1

How to remember

- Short Man May Climb high

Important Information

- Alagille Syndrome
  - Neonatal cholestasis
  - Triangular facies
  - Pulmonary stenosis
  - Butterfly vertebra
- Triangular facies also seen in Russell Silver Syndrome



Achondroplasia

- **A** - Autosomal dominant inheritance
- **C** - Champagne glass pelvis on x ray
- **H** - Hand abnormality (Trident Hand)
- **O** - Obesity
- **N** - Neurological problems
- **D** - Delayed motor milestones
- **R** - Recognized at birth
- **O** - BOwing of legs
- **P** - Proximal limb shortening
- **LA** - LArge head
- **S** - Short stature
- **I** - **Interpedicular** distance b/w vertebra decreases

How to remember

- ACHONDROPLASI

Important Information

- Gene involved: FGFR 3 gene [Fibroblast Growth Factor Receptor 3 Gene

Osteogenesis Imperfecta/ Brittle Bone Disease

- Triad
  - Recurrent fractures / Body deformity
  - Blue sclera
  - Deafness
- Type-I collagen Defect
- Dentinogenesis imperfecta (Dental problem)
- Rx: Bisphosphonates [Pamidronate]

TALL STATURE 00:48:14

- **Definition:** Height of a child > + 2 S.D. of expected, according to age and sex of child.

- **Causes of Tall Stature in Childhood**

1. Constitutional tall stature

2. Exogenous obesity
3. Endocrine causes
   - GH excess
   - Precocious puberty

4. Syndromes
   - Klinefelter syndrome (47, XXY)
   - Fragile x syndrome
   - Marfan syndrome
   - Homocystinuria
   - Soto's syndrome/ cerebral gigantism
   - Beckwith wiedemann syndrome
   - Weaver syndrome: Intellectual disability, facial dysmorphism, joint contractures.

Important Information

Tall stature during childhood but normal adult height

- Constitutional tall stature
- Exogenous obesity
- Precocious puberty
- Soto's syndrome
- Beckwith wiedemann syndrome

Table 3.1 Important causes of Disproportionate short stature

Short trunk dwarfism (US: LS ratio →Decreases)	Short limb Dwarfism (US: LS Ratio → Increases)
1. **S**hort - **S**pondyloepiphyseal dysplasia	1. Rickets
2. **M**an - **M**ucopolysaccharidosis	2. Achondroplasia
3. **M**ay - **M**uco-lipidosis	3. Osteogenesis imperfecta
4. **C**limb - **C**aries spine (pott's disease)	4. Congenital hypothyroidism
5. **H**igh - **H**emivertebra/ Butterfly vertebra	5. Chondroectodermal dysplasia

CLINICAL QUESTIONS

Q. A boy, 10 years of age was brought to the emergency of the orthopedics department after he had fallen from a height and broke his leg. On examination by the first year resident his tibia and fibula had a fracture. for the bone to ossify on place the JR wanted to assess the skeletal maturation. Which site you think is used to take x-ray for the same?

A. Knee
B. Wrist
C. Shoulder
D. Ankle

Answer: B

Solution

Skeletal maturation is assessed by noting the appearance and fusion of epiphysis at the ends of long bones.
To determine the skeletal age:

- In neonates: X-ray of knees
- In infants between **3 and 9 months** age: **X-ray of shoulder**
- **Children between 1 and 13 years age:** X-ray of **hand and wrist**
- For children between 12 and 14 years: X-ray of elbow and hip

Reference: Ghai 9thed pg 11

Q. 8 Yr old child was brought to the OPD by his mother complaining that his growth is not as much as his sibling. A JR monitors all the aspects required for growth monitoring. Out of those which one is the best indicator to monitor growth of the child?

A. Weight
B. Mid-arm circumference
C. Rate of increase in height & weight
D. Head circumference

Answer: C

Solution

- Rate of increase in height or weight as age advances - Best indicator of growth monitoring in children
- One-time measurement does not indicate if the rate of growth of the child has been normal in the recent past.
- On the other hand, serial measurements provide rate of growth.
- Plotting growth velocity is useful tool for early identification of factors affecting growth.
- Growth monitoring is done using Growth Charts.

** Mid-arm circumference, Bodyweight, and chest circumference are one-time point estimates. Therefore they are not adequate to provide information about long-term nutritional status of the child.

Reference: OP ghai 9th edition, Page number 30

4 ABNORMALITIES OF HEAD SIZE & SHAPE

ABNORMALITIES OF HEAD SIZE

- Microcephaly
- Macrocephaly

MICROCEPHALY/ SMALL HEAD

00:00:50

- **Definition:** HC of a child < - 3 SD or Z score of expected according to age & sex of child

Important Causes 00:02:17

- **Primary/ Genetic Causes**

1. **C** - CRI-DU-Chat Syndrome (5p⁻)
2. **S** - Smith Lemli Opitz Syndrome
3. **P** - Patau Syndrome (Trisomy 13)
4. **E** - Edward Syndrome (Trisomy 18)
5. **F** - Familial
6. **R** - Rubinstein Taybi Syndrome (microcephaly, nose deformity, broad deviated thumb, congenital heart disease)
7. **C** - Cornelia De Lange Syndrome

How to remember

- Cannot See P E F R in Child

- **Structural causes:** Anencephaly, Lissencephaly, Polymicrogyria, Schizencephaly
- **Secondary Causes**

Maternal Causes	Other Causes (related to baby)
1. Alcohol Intake (Fetal Alcohol Syndrome)	1. CNS Infections During Infancy (Meningoencephalitis)
2. Smoking	2. Severe Malnutrition in Baby
3. Drugs: Phenytoin Intake	3. Perinatal Asphyxia/ HIE
4. Phenylketonuria (PKU)	4. Inborn errors of metabolism • PKU • Methylmalonic acidemia • Citrullinemia
5. Radiation Exposure	5. Acquired Microcephaly • **R** - Rett Syndrome (X-Linked Dominant) • **A** - Angelman Syndrome • **S** - Seckel Syndrome (face of child resembles the bird)
6. Infections (TORCH)	

How to remember

- RAS

MACROCEPHALY / LARGE HEAD

00:10:58

- **Definition:** HC > + 2 SD or Z score of expected, according to age & sex of child

Important Causes 00:11:47

1. ↑ Thickness of Cranial Bones
   - Chronic hemolytic anemia (Thalassemia)
   - Osteogenesis imperfecta
   - Rickets
2. Sub-Dural Fluid Collection
   - Present as effusion or empyema
   - As a complication of Meningitis
3. Megalencephaly (↑ Size of Brian)
   - **B** - Benign familial megalencephaly → runs in families (MCC of megalencephaly in children)
   - **A** - Amino acid disorders
     - Maple syrup urine disease (MSUD)
     - Type - I Glutaric aciduria
   - **L** - Lysosomal storage disorder
     - Mucopolysaccharidosis, GM1 Gangliosidosis, Taysach's disease,
   - **W** - Weaver syndrome
   - **A** - Achondroplasia (Short Limb Dwarfism)
   - **N** - Neurodegenerative disorder (Regression of milestones)
     - Alexander disease (GFAP gene: Glial fibrillary protein deposition)
     - Canavan disease (ASPA gene: Deposition of NAA in brain)
   - **S** - Soto's syndrome/ cerebral gigantism
   - **N** - Neurocutaneous disorders (For ex. NF, TS, Sturge weber syndrome)
   - **G** - Galactosemia

How to remember

- BALWAN SiNGh

4. Hydranencephaly
- Cerebral hemispheres are absent & replaced by fluid filled sacs
- Transillumination is +ve
5. Hydrocephalus (↑ in size of ventricles inside brain due to increased production or impaired drainage of CSF): For details, please refer to the section on Pediatric Neurology
- Treatment: VP shunt

ABNORMALITIES OF HEAD SHAPE 00:24:45

Abnormalities of Head shape

Plagiocephaly:	**Craniosynostosis:**
Asymmetric flattening of one side of skull	Premature fusion of ≥1 cranial sutures

Craniosynostosis
- What is it?
  - Premature fusion of cranial sutures
- How to recognize clinically?
  - Abnormal head shape along with palpable ridge in the suture line that is prematurely fused

- Normal sequence of fusion of cranial sutures-
  - Metopic suture (2 months)
  - Sagittal suture
  - Coronal suture
  - Lambdoid suture (22-26 months)
  - Frontonasal and frontozygomatic sutures fuse last (Around 6 years)

- Dolichocephaly (Scaphocephaly)
  - Elongated head due to premature fusion of sagittal suture
  - Most common type of craniosynostosis
- Trigonocephaly (triangular in shape)
  - Premature fusion of metopic suture
- Turricephaly (Oxycephaly)
  - Premature fusion of coronal, spheno-frontal, fronto-ethmoid sutures
- Brachycephaly
  - Premature fusion of coronal sutures

Important Information

- M / C Type of abnormality: Dolichocephaly.

Syndromes Associated with Craniosynostosis 00:32:39
- Crouzon syndrome
  - Features of Crouzon syndrome
    - → Brachycephaly
    - → Bulging eyes
    - → Midface hypoplasia (Cheeks underdeveloped)
- Apert syndrome
  - Bulging eyes
  - Antimongoloid slant of eyes
  - Mitten hands due to syndactyly
- Carpenter syndrome
- Pfeiffer syndrome

Previous Year's Questions

Q. Most common cause of craniosynostosis la?
(JIPMER - Nov - 2018)

A. Plagiocephaly
B. Brachycephaly
C. Scaphocephaly
D. Trigonocephaly

FONTANELLES 00:35:21

	2 most important fontanelles	
	Anterior Fontanelle (AF)	**Posterior Fontanelle (PF)**
Shape	• Diamond	• Triangular
At junction of	• Frontal and parietal bones	• Parietal & occipital bones
Sutures	• At junction of coronal and sagittal sutures	• At junction of sagittal & lambdoid sutures
Closes by	• 18 months of life	• Either closed at birth or admits tip of a finger or closes at 6-8 weeks of life

Anterior Fontanelle
- Size – 2 x 2 cm
- Diamond shaped
- Level: Slightly depressed & pulsatile

- How to examine: Best Examined by holding in the infant in sitting position when baby is asleep or feeding

Important Information

- **MC cause of bulging AF is Crying/ Irritable child**

Bulging Fontanelle

- Increased ICP e.g.: Meningitis, Intraventricular hemorrhage.

Depressed/ Sunken AF: Dehydration E.g. Diarrhoea

Small AF

- Craniosynostosis (premature fusion of cranial sutures)
- Microcephaly
- Wormian bones/Accessory bones

Large AF

- **D** - Down syndrome (Trisomy 21)
- **R** - Rickets
- **O** - Osteogenesis imperfecta
- **P** - Prematurity
- **C** - Cleidocranial dysostosis
- **A** - Achondroplasia
- **T** - Trisomy 13, 18
- **C** - Congenital Rubella Syndrome
- **H** - Hydrocephalus/ Hyperthyroidism

How to remember

- DROP CATCH

Previous Year's Questions

Q. Which of the fontanelle is the last to close?
(NEET Jan 2018)

A. Posterior fontanelle
B. Anterior fontanelle
C. Mastoid fontanelle
D. Sphenoidal fontanelle

CLINICAL QUESTIONS

Q. A 5 months old female child is admitted in the hospital's pediatric department with the H/O vomiting, poor breastfeeding, &high pitch cry, is more irritable and head growing big abnormally and also had episodes of seizures in between, since last 2 days. On examination, prominent veins over the head were seen. Investigations like CT & MRI head were done. Which shunt surgery of choice are doctors preparing to perform on the baby?

A. Ventriculo-pleural shunt
B. Ventriculo-atrial shunt
C. Ventriculo-peritoneal shunt
D. Ventriculo-pericardial shunt

Answer: C

Solution

Ventriculo-peritoneal shunt is the Shunt surgery of choice for treatment of hydrocephalus in children.

Hydrocephalus:-condition in which an accumulation of cerebrospinal fluid (CSF) occurs within the brain.

Therapy for hydrocephalus:

- Medical management:
  - Acute presentation → 3% NaCl or mannitol
  - Chronic presentation: Acetazolamide / Glycerol
- Surgical treatment:
  - Most cases of hydrocephalus require a ventriculoperitoneal shunt (VP shunt).
  - Endoscopic third ventriculostomy (ETV) [for aqueductal stenosis] has evolved as a viable approach.

Reference: Ghai 9th ed pg 578

Q. A 2 year old female child, normal at birth, having normal early development, now presents with microcephaly, regression of acquired language & motor milestone along with abnormal stereotypic hand wringing movements. Most likely diagnosis is?

A. Angelman syndrome
B. Rett syndrome
C. Asperger syndrome
D. Metachromatic leukodystrophy

Answer: B

Solution

Rett syndrome: cause of acquired microcephaly

- X linked dominant inheritance
- MC gene involved - MECP2 gene

- MC in females
- Normal head circumference at birth
- Deceleration of head growth
- Developmental delay followed by loss of purposeful hand movement with development of stereotypic hand wringing movement

Asperger syndrome: characterized by significant difficulties in social inheritance and nonverbal communication along with restricted and repetitive patterns of behavior and interest.

Metachromatic Dystrophy: lysosomal storage disease that causes progressive demyelination of central (white matter) and peripheral nervous system.

Angelman syndrome: Seizures, ataxia, mental retardation, inappropriate laughter (happy puppets)

Reference: Nelson 21st ed/p- 12430

5 NORMAL & ABNORMAL DENTITION

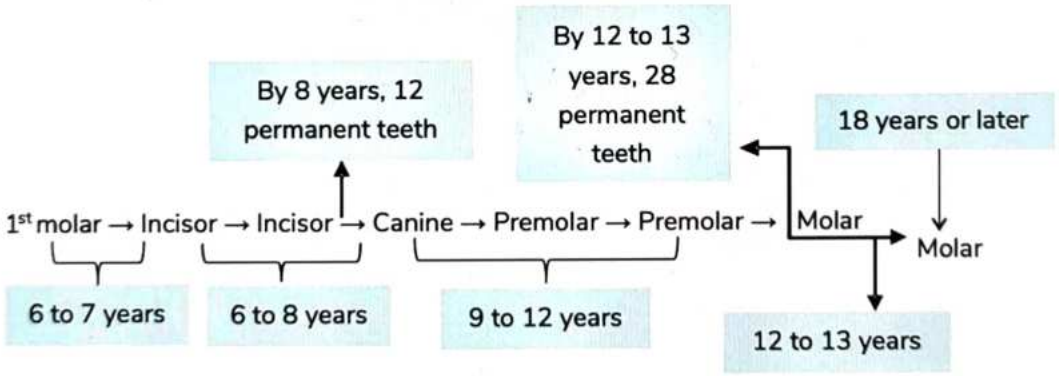
NORMAL DENTITION

00:00:17

	Primary Dentition Milk/ Temporary Teeth	Secondary Dentition / Permanent Teeth
Begin at	6 months	6 years
1st tooth to erupt	Lower central incisor	1st molar
Last tooth	Second molar	3rd molar (or) wisdom tooth
Completes at	2 and half – 3 years	12 years except the 3rd molar (18-25 years)
Total no. of teeth	20	28-32
Teeth in each quadrant (ICPM)	I C P M	I C P M
	2 1 0 2	2 1 2 3

Sequence in which teeth erupt

- Milk teeth → Lateral central incisor → Lateral incisor → Molar incisor → Canine incisor → 2nd molar



- Period of Mixed Dentition: 6 - 12 Years

ABNORMALITIES OF DENTITION

00:09:19

Delayed Dentition

- When no tooth erupts by the age of 13 months
- **Important Causes**

1. **F- F**amilial
2. **R - R**ickets
3. **I - I**diopathic, Incontinentia pigmenti
4. **E- E**ndocrine
   - Hypopituitarism
   - Hypothyroidism
   - Hypoparathyroidism
5. **D - D**own syndrome
6. **C - C**leidocranial dysostosis
   - Absent clavicles (complete or partial absence)
   - Large anterior fontanelle
   - Delayed closure of anterior fontanelle

- Supernumerary teeth (also found in Gardner syndrome → precancerous condition of carcinoma of colon)

How to remember

- Fried Chop

Natal Teeth 00:13:24

- Baby born with teeth
- Present in following conditions

1. **P** - Pierre Robin sequence: Micro or Retrognathia
2. Ellis van creveld syndrome
   - Congenital heart disease
   - Short limb dwarfism
   - Polydactyly
   - Nail abnormalities
3. Epidermolysis bullosa (lethal acantholytic variety)
4. Soto's syndrome

How to remember

- PEES

Hutchinson's Teeth 00:15:15

- Notched incisors (Peg shaped)
- Seen in congenital syphilis
- Hutchinson's triad: Hutchinson's teeth, interstitial keratitis, SNHL (Late manifestation of congenital syphilis)

IMAGE BASED PRACTICE QUESTIONS

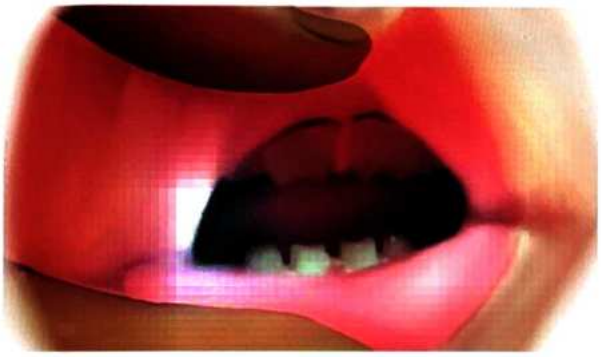
Q. Identify the syndrome in this child with short stature?

Ans. Seckel syndrome (bird headed dwarfism)

- Microcephaly
- Elongated face
- Beak like nose

CLINICAL QUESTIONS

Q. The teeth abnormality seen below is seen in which of the following diseases?



A. Cleidocranial dysostosis
B. Congenital Syphilis
C. Congenital Rubella
D. Congenital hypothyroidism

Answer: B

Solution

The teeth abnormality shown - 'Hutchinson's teeth', which are notched incisors, seen in **Congenital Syphilis.**

Early signs of congenital syphilis:

- Hepatosplenomegaly
- Jaundice
- Diffuse lymphadenopathy
- Painful osteochondritis and periosteitis (Pseudoparalysis)
- Mucocutaneous erythematous, maculopapular rash or vesiculobullous rash
- Followed by desquamation involving hands and feet

Late signs of congenital syphilis:

- Olympian brow
- Saber shins
- Hegoumenaki sign
- Hutchinson's triad
- Mulberry molars
- Saddle nose
- Rhagades
- Clutton joints

****Hutchinson's triad- Huchtinson's teeth, Interstitial keratitis, SNHL**

Other options:

Cleidocranial Dysostosis - Malocclusion of jaw, delayed appearance of secondary teeth and prolonged persistence of primary teeth (peg like teeth)

Congenital hypothyroidism - Delayed eruption of teeth, umbilical hernia, protruded tongue , dry & scaly skin

Congenital Rubella - Cataract, Heart disease (PDA), SHNL, have exaggerated dental problems

Reference: Nelson's 21/e p- 1697

Q. Parents bring their 8-year-old child to the dentist after he had a blow on the face by the football while playing with his friends. one incisor from the right upper quadrant & one from the right lower quadrant were broken and had to be taken out. How many permanent teeth will the child have at that time?

A. 20
B. 24
C. 12
D. 16

Answer: C

Solution

Permanent teeth erupt in the following order:

First molar	6-7 years
Central and lateral incisors	6-8 years
Canine and premolars	9-12 years
Second molar	12-13 years
Third molar	18 years or later

- So at the age of 8 years, first molar, central and lateral incisors would have erupted in each quadrant
- Hence, total of 12 permanent teeth will be present at the age of 8 years

Reference: Nelson 21st ed/ p-1198

LEARNING OBJECTIVES

UNIT 2 NORMAL DEVELOPMENT

- Important motor milestones
  - Development , its rules, domains in detail
- Social and language milestones
  - Discussed in detail
- Developmental implications of important milestones
  - Gross motor
  - Fine motor
  - Social
  - Language

6 IMPORTANT MOTOR MILESTONES

DEVELOPMENT

00:00:15

- Attainment of maturity of functions
- Rules of Development
  - Continuous process, starting in utero
  - Sequence of attainment of milestones remains same
  - Depends on neurological status of child
  - Cephalo-caudal direction
  - Truncal development followed by limb development
  - Certain primitive reflexes have to be lost (e.g. ATNR is lost when child starts crawling)
- Domains of Development 00:03:33
  - Gross motor
  - Fine motor
  - Social
  - Language
- Developmental assessment of preterm baby is done using "corrected/adjusted age" till 2 years of age.
  - Corrected/adjusted age = (gestational age + chronological age)-40 weeks
  - E.g. gestational age = 30weeks
    →Now age of baby =12weeks old
    →Corrected age = (30+12)-40
    =2 weeks

GROSS MOTOR

00:06:51

In ventral suspension

1 month	Head is below the plane of rest of body due to no neck control

2 months	Head in the plane of body, neck control begins to develop

3 months	Head goes above the plane of the body, Neck control develops more

In prone position

2 weeks	Baby lies on bed with high pelvis and knee drawn under the abdomen.
4 weeks	Lifts chin of the bed momentarily
6 weeks	Lies on bed with flat pelvis and extended hips
8 weeks	Lifts face up at 45 degrees
12 weeks	Can bear his weight on forearm with and shoulder lifted off the couch
6 months	Can support his weight on hands or extended arms

Other milestones

4 months	Partial weight bearing when made to stand
5 months	Feet to mouth, complete neck control
6 months	• Sitting with support / sitting in tripod position • Prone to supine
7 months	Supine to prone
8 months	Sitting without support; crawling
9 months	Standing with support
10 months	Creeping
10-11 months	• Pivoting • Cruising
1 year (12 months)	• Stand without support • Walk with support • Walk with one handheld

13 months	• Walks without support
15 months	Creep upstairs
18 months	• Goes upstairs & downstairs holding the side railing • Runs • Pulls a toy
2 years	• Goes upstairs & downstairs 2 feet per step • Kicks a ball • Walks backwards
3 years	• Goes upstairs with alternating feet & downstairs 2 feet / sleep • Rides a tricycle
4 years	• Goes upstairs & downstairs with alternating feet • Hopping
5 years	• Skipping • Can stand on 1 leg for > 10 sec

Previous Year's Questions

Q. A 6 year old child with developmental delay, can ride a tricycle, can climb upstairs with alternate feet, but downstairs with 2 feet per step, can tell his name, knows his own sex, but cannot narrate a story. What is his developmental age?

(AIIMS May 2019)

A. 3 years
B. 4 years
C. 5 years
D. 2 years

FINE MOTOR

00:24:50

1 month	Hands kept closed
2 months	Hands open intermittently
3 months	Hands kept open Hold an object when placed in hand 'Hand regard' appears (disappears at 20th week)
4 months	Tries to reach an object, but overshoots
5 months	Bidextrous grasp
6 months	• Unidextrous or palmar grasp • Can take a biscuit to his mouth
7 months	Transfer objects from 1 hand to another
9 months	Immature/ assisted pincer grasp
12 months	• Mature/ unassisted pincer grasp. • Pulls off cap/mittens/socks
15 months	• Scribbles spontaneously • Feeds self with a cup • Tower of 2 cubes
18 months	• Tower of 3 cubes • Feeds self with a spoon • Turn 2-3 pages at a time • Unzips
2 years	• Tower of 6-7 cubes • Can make a train with blocks • Turns a doorknob or unscrew a lid • Turns pages singly • Wears socks and shoes • Copies a horizontal or vertical line
2.5 years	• Makes a train with chimney
3 years	• Handedness gets established (appears at 24 months) • Tower of 9-10 cubes • Copies a circle • Can dress/undress self except buttons

4years	• Copies a rectangle or a plus sign or cross (+) • Makes a bridge with cubes • Can button and unbutton • Catches a ball reliably
5 years	• Copies a triangle or multiplication sign or tilted cross (X) • Can tie shoelaces • Makes a gate with cubes
6-7 years	• Copies a diamond • Can make steps with cubes

Previous Year's Questions

Q. A child transfers objects from one hand to other. What does it imply?

(AIIMS June 2020)

A. Visual motor co-ordination
B. Explores small objects
C. Object release
D. Comparison of objects

CLINICAL QUESTIONS

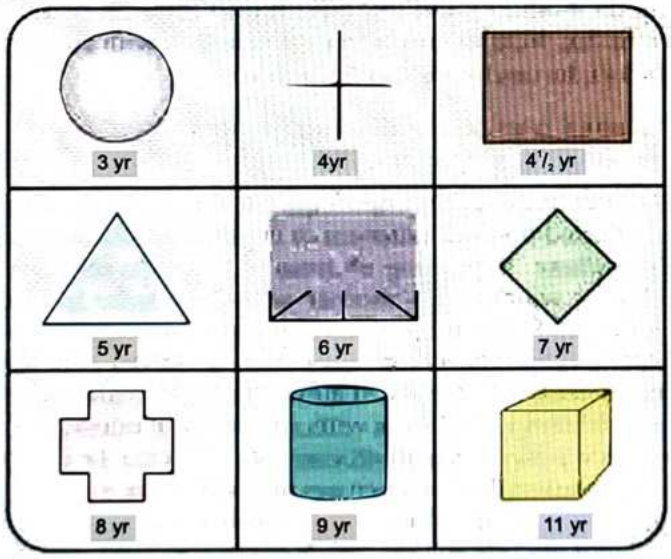
Q. A child is able to draw and copy cross & square at the age of 4. His mother plays with him and makes a triangle and the child tries to copy that and he is successfully able to do it. At what age is he able to perform this?

A. 2 years
B. 3 years
C. 4 years
D. 5 years

Answer: D

Solution

A child is able to draw a triangle by the age of:- **5 years**



Drawing skills at various ages

Reference: Ghai 9th ed/ p- 46

Q. Parents of a 15 months old child bring toys for him, baby is given a walker, a plush ball that he plays with both his hands even throws it. Parents see that he plays with all the objects but when they try to make him say few words he doesn't follow. Which milestone is yet to be achieved by the child?

A. Walking with support
B. Transfers objects from 1 hand to another
C. Builds tower of 2 cubes
D. Speaks three-word sentences

Answer: D

Solution

A child speaks 2 word sentences at 2 years and **3 word sentences at 3 years**

- walks with support 12 months onwards,
- transfers objects at 7 months,
- builds a tower o1f 2 cubes at 15 months

Reference: Nelson's 21/e p 1652

7 SOCIAL & LANGUAGE MILESTONES

SOCIAL

00:00:11

1 month	Looks at the mother intently when talked to
2 months	Social smile
3 months	Recognizes mother
6 months	Mirror play appears
7 months	Stranger anxiety appears
8 months	Object permanence
9 months	Waves bye-bye
10 months	Plays peek a boo
12 months	• Kisses on request • Plays a simple ball game
15 months	• Points to objects • Indicates wet Pants (2 'P's)
18 months	• Domestic mimicry • Dry during daytime (2 'D's)
2 years	• Parallel play • Can point to 3-4 body parts • Points to 5-6 familiar objects
3 years	• Joins in play • Knows his name, age, gender • Dry at night usually
4 years	• Goes to the toilet alone • Starts asking questions
5 years	• Starts helping in simple household tasks • Distinguishes morning from evening • Compares 2 weights • Can follow 3 step commands

LANGUAGE

00:08:11

1 month	Quietens when a bell is rung
2 months	Vocalizes
3 months	Cooing
4 months	Laughs aloud
5 months	Razzing
6 months	Mono-syllabic babbling (ma, ba, da)
9 months	Bi-syllabic babbling (mama, papa but without meaning)
1 year	Speaks 2-3 words with meaning
15 months	Jargon speech
18 months	Vocabulary of 8-10 words with meaning
2 years	• Speaks 2 words sentences • Vocabulary of 50-100 words • Uses pronounces like I, ME, YOU
3 years	• Uses plurals & past tense • Repeats 3 digits, 3 words sentences
4 years	Tells a story/ poem, sings a song
5 years	• Repeats 4 digits • Names 4 colors • Asks meanings of words

VISION

00:13:16

- Birth: Can fixate on a red dangling ring and follows it to 45 degrees
- 4 weeks: Can follow the red dangling ring to 90 degrees
- 12 weeks: Can follow the red dangling ring to 180 degrees
- 3 months: Fixates instantaneously on an object shown to him (grasps with eyes)
- Binocular vision: Begins to develop by 6 weeks and established by 4 months of age
- 1 year: Follows rapidly moving objects

HEARING (Murphy's Sequence)

00:15:32

- Newborns: Respond to sound by startle/blinking/crying
- 3-4 months: Turns head towards source of sound
- 5-6 months: Turns head towards source and then downwards if the source of sound is below the level of ears
- 7-8 months: Localizes sound produced above the level of ears
- 10 months: Looks directly towards the source diagonally

CLINICAL QUESTIONS

Q. Mother teaches her 1 yr old child new words everyday, as his age increases he is able to grasp more words. What would be his Vocabulary on his 2nd birthday?

A. 20 words
B. 30 words
C. 100 words
D. 200 words

Answer: C

Solution

- Vocabulary at 2 years is **100 words.**
- 18 months- 8-10 words
- 12 months- 1-2 words

Reference: Ghai 9/e p-48

Q. A child who is admitted in the IPD of pediatric dept. upon improvement in her health was making cooing sound and was laughing aloud. However, she was not able to sit. She was not able to engage in mirror play and did not have any stranger anxiety. While the senior doctor was taking a clinical class for the final year students, one of them asked the age of this child, and students were told to guess from the clue she was already showing while playing?

A. 2 months
B. 4 months
C. 6 months
D. 9 months

Answer: B

Solution

A child laughs aloud at the age of 4 month.

- 1 month → alerts to sound
- 2 months → Vocalizes
- 3 months → Coos
- 4 months → Laughs aloud

Reference: Ghai, 9th edition/p-49

8 DEVELOPMENTAL IMPLICATIONS OF IMPORTANT MILESTONES

GROSS MOTOR MILESTONES

00:01:15

- Holding the head steady while sitting: Allows more visual exploration/ interaction
- Sitting without support: Increasing exploration
- Walks alone: Exploration; controls proximity to parents

FINE MOTOR MILESTONES: DEVELOPMENTAL IMPLICATION

00:03:25

- Hand regard: Self-discovery of hands
- Grasps a rattle: Object use
- Reaches for objects: Visuomotor coordination
- Palmar grasp gone: Voluntary release of objects
- Transfers objects from 1 hand: Compare object to another(AIIMS May 2020)
- Pincer grasp: Able to explore small objects
- Scribbling: Visuomotor coordination
- Builds a tower of 2 cubes: Uses objects in combination.

Previous Year's Questions

Q. A child transfers objects from one hand to other. What does it imply?

(AIIMS June 2020)

A. Visual motor co-ordination
B. Explores small objects
C. Object release
D. Comparison of objects

SOCIAL MILESTONES: DEVELOPMENTAL IMPLICATION

00:09:09

- Social smile: More active social participation
- Follow 1st step command with gesture: Nonverbal communication
- Points to objects: Interactive communication
- Uncovers toys after it is hidden: Object permanence
- Pretends to drink from a cup: Symbolic thought
- Uses stick to reach toys: Links actions to solve problems

LANGUAGE MILESTONES: DEVELOPMENTAL IMPLICATIONS

00:13:49

- Monosyllabic babbling: Experimentation with sound
- Follows 1st step commands without gesture: Verbal receptive language
- Says 'mama' or 'dada': Expressive language.
- Speaks 1st real word: Beginning of labeling
- Speaks 4-6 words: Acquisition of object & personal names
- Speak 2 - word sentences: Beginning of grammatization

LEARNING OBJECTIVES

UNIT 3 DEVELOPMENTAL AND BEHAVIOURAL DISORDERS

- **Abnormalities of development**
  - Types of developmental abnormalities
  - Developmental red flags
  - Causes of developmental delay
  - Developmental assessment
  - Intellectual disability

- **Behavioral disorders**
  - Nocturnal enuresis
  - Pica
  - Thumb sucking
  - Bruxism
  - Breath holding spell
  - Tics
  - Autism
  - ADHD and others related disorders

9 ABNORMALITIES OF DEVELOPMENT

ABNORMALITIES OF DEVELOPMENT (3 'D' S)

00:01:42

1. **Delay**
2. **Dissociation**
3. **Deviancy**

1. Developmental Delay

00:01:56

- When child's performance in 1 or more domains is significantly below average or what is expected.

Important Information

- **If developmental delay involves 2 or more domains - Global Developmental Delay**

2. Developmental Dissociation

00:03:11

- Substantial difference in the rate of development of milestones in 2 or more domains
- Example: Isolated speech delay is a developmental dissociation since only language is hampered while all other domains are normal.

3. Developmental Deviancy

00:04:48

- Developmental milestones occurring out of sequence.
- Example: If Crawling comes before sitting.

DEVELOPMENTAL RED FLAGS

00:06:03

- The upper time limit by which the milestones should usually be attained.

Gross motor	Upper limit	Usual time
Sitting with support	9 months	6 months
Standing with support	12 months	9 months
Walking with support	15 months	12 months

Fine motor	Upper limit	Usual time
Pincer grasp months	12 months	9 months
Scribbling	24 months	15 months

Social	Upper limit	Usual time
Social Smile	6 months	2-3 months
Waving bye-bye	12 months	9 months

Language	Upper limit	Usual time
Babbling	12 months	6 months
Single words	15-16 months	1 year

- If these milestones are not attained by this time, then there is probably some underlying abnormality of development.

IMPORTANT CAUSES OF DEVELOPMENT DELAY ("CDGP PIC")

00:09:22

1. **C** - Chromosomal abnormalities (Trisomy 21, 13, 18)
2. **D** - Developmental brain abnormalities (lissencephaly-brain appears smooth due to less gyri & sulci, myelomeningocele)
3. **G** - Genetic syndromes (Fragile X Syndrome, Rett syndrome, Prader Willi syndrome)
4. **P** - Perinatal factors: Asphyxia, HIE (Hypoxic Ischemic Encephalopathy)
5. **P** - Postnatal factors: Trauma, infections, Hypothyroidism
6. **I** - Inborn errors of Metabolism: Maple Syrup Urine Disease, organic Acidemia, Tay sachs disease, GM Gangliosidosis, Mucopolysaccharidosis
7. **C** - Congenital infections: TORCH group (Toxoplasmosis, Other agents, Rubella, CMV, Herpes)

How to remember

- CDGP PIC

DEVELOPMENTAL ASSESSMENT

00:13:30

Developmental quotient [D.Q.]

- D.Q = Developmental age/Chronological age x 100
- E.g. A child of 6 years of age has attained milestones of that of a 3 year old only. Calculate D.Q.
  Solution: DQ = 3yr/ 6yr x 100 = 50

Screening Tests for Developmental Assessments

00:15:05

1. **P** - Phatak's Baroda Screening Tests
2. **A** - Ages & stages questionnaire
3. **R** - Revised DDST (Denver Developmental Screening Test)
4. **T** - Trivandrum development screening chart

How to remember

- PART

DEFINITIVE TESTS FOR INTELLECTUAL AND DEVELOPMENTAL ASSESSMENT

00:16:48

Name of test	Age group
Vineland adaptive behavior scale II	Birth to 89 years
Bayley scale for Infant development II	1 month-3.5 years
Stanford Binet Intelligence scale	2 years-85 years
Wechsler Intelligence Scale for Children	6 years-17 years

INTELLIGENCE QUOTIENT (IQ)

00:19:14

- IQ = Mental age/ Chronological age x 100

Degree	IQ Level
• Mild ID	51 – 70
• Moderate ID	36 – 50
• Severe ID	21 – 35
• Profound ID	0 – 20
• Moron	50 – 70
• Imbecile	30 – 50
• Idiot	< 30

- The term mental disability is no longer used now.
- It has been replaced by term intellectual disability.

CLINICAL QUESTIONS

Q. Persistence of this milestone beyond what age is considered abnormal?

A. 3 months
B. 5 months
C. 7 months
D. 9 months

Answer: B

Solution

The given picture shows 'hand regard' i.e. the child observes his own hands intently.

- It appears at 12 weeks
- **Its persistence beyond 20 weeks (5 months) is considered abnormal.**

Reference: Ghai 9th ed pg 44

Q. A 6 year old child was being examined in the OPD by the JR when he notices that the child's development is not normal. He asks the interns present there to calculate his DQ, which came out to be equal to that of child half his age. Which of the following milestones this child has achieved according to his DQ?

A. Identify 5 colors
B. Speak short sentences
C. Ride a bicycle
D. Copy a triangle

Answer: B

Solution

DQ = Developmental age x 100/actual age

6 year old child has a DQ of 50; so his developmental age is 3 years. So he can do milestones corresponding to 3 years only.

- Speaks short sentences - at 2 years (child can speak 2 word sentences at 2 years and 3 word sentences at 3 years)

- Ride a **tri**cycle- at 3 yrs
- Name 2 colors - At 3 years
- Name 5 colors - At 5 years
- Copy a triangle- at 5 years
- Since option 2 is the only milestone the child has reached, so the answer is option 2.

Reference: Nelson's 21/e p 1150

10 BEHAVIOURAL DISORDERS IN CHILDREN

NOCTURNAL ENURESIS

00:00:29

- Definition: Involuntary passage of urine in children at night beyond 5 years of age.
- Epidemiology
  - Boys : girls = 60:40
  - Family history is positive in 50%
  - If 1 parent has history of Nocturnal Enuresis, each child has 44% risk of developing Nocturnal Enuresis.
  - If both parents have history of Nocturnal Enuresis, each child has 77% risk of developing Nocturnal Enuresis.

Types

- Primary Nocturnal Enuresis: Child has never attained urinary continence at night (More Common type)
- Secondary Nocturnal Enuresis: Child had attained urinary continence & has now developed Nocturnal enuresis

Management

- 1st Line: Diet & Lifestyle changes restrict intake of caffeine, sugary substances/ much fluids after evening time
- Give child early dinner & restrict intake of more fluids after dinner + motivational Therapy (Star Chart) – the child is given a star for each dry night and when there are 7 consecutive stars, he /she is given a gift which boosts up the child.
- 2nd Line: Bed and alarm technique
  - These are moisture sensing alarms.
  - As soon as the child passes urine in bed, the alarm would detect the moisture in undergarment of the child & it will ring.
  - Child wakes up, go to toilet & micturates.
  - These alarms produce excellent response.
- 3rd Line: Drugs (used for refractory cases or short-term management)
  - Oral Desmopressin
  - Imipramine
  - Oxybutynin
- Combination of Drugs and Bed & alarm technique provides the lowest relapse rates.

Previous Year's Questions

Q. An 8 year old male child presented with history of bed wetting. There are no other associated symptoms, apart from the discomfort due to bedwetting. What is the initial and most effective therapy? (INICET Nov 2020)

A. Pharmacological therapy with imipramine
B. Bladder training with holding urine foe longer periods during daytime
C. Classical conditioning with alarm &pad at night
D. Psychodynamic therapy

PICA

00:06:57

- Persistent eating of non-nutritive, non-food substances over a period of at least 1 month
- More common in children with intellectual disability & autism spectrum disorders
- **Treatment:** Behavioral therapy

THUMB SUCKING

00:08:07

- Self-soothing behavior
- Common in infancy [seen in 25% of children around 2 years]
- Thumb sucking beyond 5 yrs may be associated with sequelae or complications like Paronychia, anterior open bite etc.
- **Treatment:** behavioral therapy

BRUXISM (TEETH GRINDING) 00:09:19

- Seen in 5-30% of children
- Begins in the 1st 5 years of life
- Associated with increased daytime anxiety
- Persistent Bruxism can manifest as muscular/ temporomandibular joint pain/ dental malocclusion
- **Treatment:** Behavioral therapy

BREATH HOLDING SPELLS 00:10:40

- Results from immaturity of ANS (Autonomic Nervous System)
- At around 6-18 months of age
- Triggers: injury, anger, frustration
- Starts with a cry & progress to apnea, syncope, tonic posturing
- 2 types of breath holding spells
  a. Pallid: caused by reflex vagal bradycardia & asystole
  b. Cyanotic: due to prolonged expiration, apnea, intrapulmonary shunting of blood
- **Treatment**
  - Reassurance
  - Treatment of co-existing Iron deficiency anemia

TICS & STEREOTYPIES 00:13:49

Tics	Stereotypies
• Sudden, non-rhythmic, • Rapid, recurrent, • Motor movements or • Vocalizations • Seen in Tourette Syndrome	• Stereotyped, rhythmic, repetitive movements or patterns of speech with lack of variation over time

Previous Year's Questions

Q. **All are habit disorders except?** (NEET Jan 2018)

A. **Nail biting**
B. **Thumb sucking**
C. Temper tantrum
D. **Tics**

AUTISTIC SPECTRUM DISORDERS (A.S.D) 00:15:46

- Persistent impairment in reciprocal social communication & interaction & restricted, repetitive patterns of behavior or interest
- Risk Factors
  - Closer spacing of pregnancies
  - Extremely prematurity (<26 weeks)
  - Family members with learning/psychological problems
  - Antenatal exposure to Thalidomide, valproate
  - Antenatal Rubella exposure
- Screening Test
  - M-CHAT: (Modified checklist for autism in toddlers) used in 10-30 months age group
- Treatment
  - Cognitive Behavior Therapy
  - Treatment of co morbidities like Atomoxetine for hyperactivity
  - Intra nasal oxytocin (upcoming therapy)

ATTENTION DEFICIT HYPERACTIVITY DISORDER (ADHD) 00:21:12

- Persistent inattention / Hyperactivity / Impulsivity that interferes with functioning / development of child, present for at least 6 months, in 2 or more settings, beginning before 12 years of age and must not be secondary to another disorder
- **Risk Factors**
  - Maternal smoking, alcohol, lead or mercury exposure
  - Genetic component – DAT-1 & DRD-4genes
  - Abnormal Brain Structure
  - CNS Trauma
  - Psychologic Family stress
  - Epilepsy
  - Tuberous sclerosis, Neurofibromatosis

Important Information

- **MC Neurobehavioral disorder of childhood is ADHD**
- **Approximately 2% of adults have ADHD**
- **60-80% of children with ADHD continue to have it in adolescence & up to 60% of adolescents exhibit ADHD symptoms into adulthood**

- **Treatment:** Drugs
  - Methylphenidate
  - Amphetamine
  - Atomoxetine

RETT SYNDROME 00:27:39

- X-linked dominant inheritance
- More common in girls
- Most Common gene involved: MECP-2 gene
- Head Circumference is Normal at birth

- Development - Normal in 1st few months of life

↓

Deceleration of head growth occurs

↓

Acquired microcephaly,
Delayed development

↓

Loss of purposeful hand movements

↓ causing

Development of stereotypic hand wringing movements

↓

Gait/posture apraxia

Rett Syndrome

- Rett Syndrome is associated with
  - Speech problems
  - Seizures
  - Breathing irregularities
  - Intellectual disability

Previous Year's Questions

Q. A 2-year-old female child, normal at birth, having normal early development, now presents with microcephaly, regression of acquired language and motor milestone along with abnormal stereotypic hand wringing movements. Most likely diagnosis is? (JIPMER Nov 2018)

A. Angelman syndrome
B. Rett syndrome
C. Asperger syndrome
D. Metachromatic leukodystrophy

SELECTIVE MUTISM

00:31:27

- Failure to speak in specific social situations despite being able to speak normally in other situations.
- Usually a symptom of underlying anxiety disorder.
- Usually associated with excessive shyness/dependency on parents.
- There may history of anxiety symptoms in 1 or both parents.
- **Treatment:** Cognitive behavioral therapy (the aim is to reduce the anxiety)

CLINICAL QUESTIONS

Q. A 6-year old-child was brought with complaints of bed-wetting at night and not during day time. His urine specific gravity was 1.020 and other tests were normal. What will you advice?

A. Reassure
B. Consult a child Psychologist
C. USG abdomen
D. CT pelvis

Answer: B

Solution

Consult a child Psychologist

In this case, the child has nocturnal enuresis, with normal findings on urine examination (normal urine specific gravity is 1.016-1.022)

Normal milestones:

- 3 years- dry during day
- 5 years: dry during night

Rx:

- **Psychologic therapy** - Motivational therapy, Conditioning therapy (auditory or vibratory alarm attached to a moisture sensor in underwear).
- Pharmacologic therapy is second line and is not curative.

Reference: Ghai 9th ed/p- 58

Q. Faizal was six years old when his family contacted their family doctor. He had been diagnosed as having autism spectrum disorder two years earlier by a senior doctor at medical college. Faizal had trouble making eye contact with listeners. His expressive language was vague, his sentences were long enough and had the right grammar and syntax but the words he chose did not quite communicate his meaning and the listener had to work extra hard at decoding the message. It was hard to have a conversation with him, he had trouble with focus and attention. What statement is true regarding the same?

A. All affected children have subnormal intelligence
B. Treatment should be targeted only toward speech development
C. Seen only after 3 years of age
D. Stereotyped patterns of behaviour
E. More common in boys

Answer: D, E

Solution

Autistic disorder

- Qualitative impairment of social behaviour
- Impairment of communication skills (verbal and non-verbal)
- **Stereotypic & restricted behaviour**
- Onset before 3 years.
- More common in boys
- Children with ASD can have higher intelligence
- Structured behavioral, educational, and communication interventions are effective. The chief therapy is behavioral intervention (Applied behavioral analysis)

Reference: Ghai 9th ed/p- 55

LEARNING OBJECTIVES

UNIT 4: PUBERTY AND ADOLESCENCE

- Sequence in boys and girls
- Assessment of puberty
- Important facts related to puberty
- Staging of puberty in girls and boys
- Problems in adolescent age group.

11 PUBERTY & ADOLESCENCE

ADOLESCENT AGE GROUP

00:00:22

- A state of transition from childhood to adulthood
- W.H.O Definition of Adolescence: 10-19 years
  - Early Adolescence: 10-13 years
  - Mid Adolescence: 14-16 years
  - Late Adolescence: 17-19 years

Important Information

- **Puberty: Refers to the physical aspect of adolescence**

Sequence of Changes in Puberty in Females

00:02:35

Thelarche (Breast Development) (1st sign)
↓
Pubarche (Development of pubic & axillary hair)
↓
Growth spurt (Peak ↑ in growth velocity)
↓
Menarche (Beginning of menstrual period)

Important Information

- **Growth spurt in females occurs just before the onset of Menarche**

Sequence of Changes in Puberty in Males

00:04:30

Testicular Enlargement (1st sign)
↓
Penile enlargement
↓
Pubic hair
↓
Growth spurt
↓
Axillary hair
↓
Facial hair

} Deepening or ripening of voice

Orchidometer

00:06:55

- Device used to measure Testicular Size
- The numerical value indicates the volume of testis.

Orchidometer

Assessment of Puberty in Adolescent

00:08:00

- Done by Tanner's Staging or Sexual Maturity Rating (SMR)
- Stage 1 to 5
  - Stage 1: Pre pubertal stage
  - Stage 5: Mature adult
- Parameters used to access Puberty
  - In Females: Based on development of Breast, Pubic hairs
  - In Males: Genitalia (Testis & penis), Pubic hairs

Growth Spurt

00:10:13

- Occurs in which stage
  - In Girls: SMR stage3
  - In Boys: SMR stage 4
- Growth spurt occurs later & lasts longer in boys/males

Important Facts Related to puberty & Adolescence

00:11:10

- Earliest neuroendocrine change associated with onset of puberty is → maturation of GnRH pulse generator
- Earliest stage of puberty where sperms can be seen in urine of a boy → SMR stage 3
- Bilateral breast tissue growth may be seen in 40 – 65% of males during SMR 2-4, due to excess of estrogenic stimulation
- Menstruation usually begins 2 ½ - 3 yrs after the onset of thelarche, during SMR 3 – 4 (average age → 12 ½ yrs)
- Onset of puberty appears to be occurring at an earlier age, than previously reported, more common in girls than boys but seen in both.

- Peak height velocity (PHV) during growth spurt is
  - 8-9 cm/yr in females: Attained 6 months before menarche
  - 9-10 cm/yr in males: Continue for 2-3 yrs after females have stopped growing.

- Growth spurt begins distally with enlargement of hands feet followed by arms & legs & finally, chest and trunk.
- After attainment of PHV, males undergo an increase in lean body mass, while females develop a higher proportion of body fat.

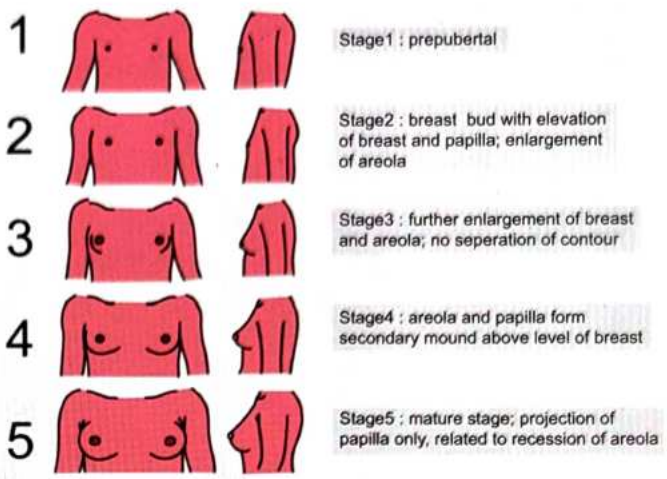
- Bone growth
  - Precedes bone mineralization → increased risk of fractures
  - Precedes muscle growth → sprains & strains common.

- Early adolescence is characterized by 'ego-centricity' – belief in some adolescents that they are the centre of everyone's attention.

- 'Separation from parents' – is a hallmark of adolescent development.
  - early adolescents seek more privacy at home
  - spend less time with parents
  - often reject parental advice

Staging of Puberty in Females 00:25:18

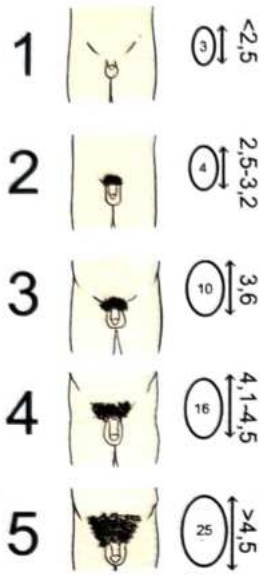
Stage	Pubic hairs	Breast
1	• No pubic hairs	• Pre-pubertal
2	• Sparse, minimally pigmented hairs, mainly on medial border of labia	• Enlargement of areola, elevation of breast & papilla
3	• Coarser & darker hairs, spread over mons pubis	• Further enlargement of breast & areola
4	• Thick, adult type distribution, but does not spread to thighs	• Areola & papilla form a secondary mound
5	• Adult type distribution, spreading to medial surface of thighs	• Mature stage: Projection of papilla only



Refer Image 11.1

Staging of puberty in Males 00:30:07

Stage	Pubic hairs	Genitalia
1	Absent	• Testicular size < 4 cc or (prepubertal) < 2.5 cm in longest dimension)
2	Sparse hair, at the base of penis	• Enlargement of testes & scrotum • Scrotal skin reddens • Slight or no enlargement of penis
3	Darker, more coarse and curled	• Further growth of testis • Penis increases in length.
4	More dense, coarse & curly hair	• Testis & scrotum longer • Scrotal skin darker • Penis increases in length & breadth, glans becomes more prominent.
5	Hair growth extends to inner thighs	• Adult genitalia (>20 ml)



Stage1 : prepubertal; testicular size less than 4cc in volume and 2.5cm in longest dimension

Stage2 : enlargement of scrotum and testes; scrotal skin reddens and changes in texture; growth of testes to 4 cc or greater in volume

Stage3 : enlargement of penis (length at first); further growth of testes

Stage4 : increased size of penis with growth in breadth and development of glans; testes and scrotum larger, scrotal skin darker

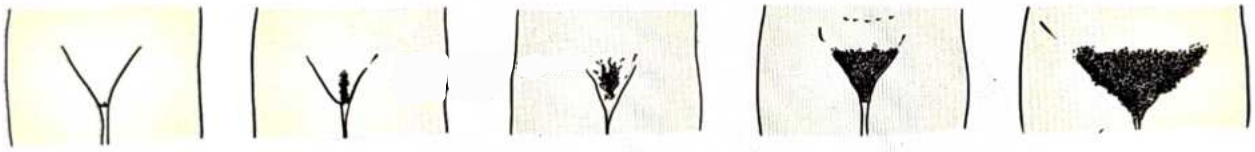
Stage5 : adult genetalia

Problems in Adolescent Age Group ('Aimless')

00:34:54

- Accidents (It's the MCC of mortality in adolescent age group) due to their high risk taking behaviour.
- Infections like STD, HIV, TB, Skin infections
- Mental health problems
  - Adjustment & anxiety disorders
  - Depression
  - Delinquent behavior
- Low self-esteem and body image issues
- Eating and nutritional disorders (Anorexia nervosa/ Bulimia nervosa)
- Sleep disturbances
- Substance abuse: Tobacco, Alcohol

Image 11.1



1. Prepubertal. no pubic hair

2. Sparse growth of minimally pigmented hair, mainly on the labia

3. Considerably darker and coarser hair spreading over the mons pubis

4. Thick adult-type hair that does not yet spread to the medial surface of the thighs

5. Adult-type hair distrubuted on classical inverse triangle

Stage 1:
Prepubertal. no pubic hair and genitals proportionally the same as in child

Stage 2:
Sparse hair growth at the base of the penis-slightly darkened. Scrotum and testes enlarge; scrotum thins and reddens.

Stage 3:
Hair growth darker, more coarse and curled across the mons pubis. Penis grows in and testis and scrotum continue to grow

Stage 4:
Hair growth more denser coarse and curly like in an adult, but not yet spread to inner thighs. Penis continues to grow; the glans (head) of the penis becomes more prominent. The scrotum darkens

Stage 5:
Hair growth extends to inner thighs Genitalia reach adult size and shape

CLINICAL QUESTIONS

Q. 16 years old boy, whenever he gets out to play with the other boys of his age he is bullied and the child has become anxious of being bullied. He then visits his uncle who is pediatrician and explains him. His uncle tells him about the delayed development of puberty. He asks what is the first visible sign of puberty?

A. Testicular enlargement
B. Penile growth
C. Breast hypertrophy
D. Dark scrotum

Answer: A

Solution

- In boys- first visible sign of puberty is **testicular enlargement.** While in girls, the first sign of puberty is thelarche or breast development.

Reference: Ghai 9/e p 61

Q. Ritika, a 15 yr old girl visits the gynae OPD as she has not yet started menstruating. On examining her the JR notices that she has well developed sexual characteristics and then prescribes a blood picture that includes LH levels & an USG to look for the internal reproductive organs to rule out the cause. Which one of the following is the correct order of events at puberty in a girl?

A. Thelarche-pubarche-menarche-growth spurt
B. Pubarche-thelarche-growth spurt-menarche
C. Menarche-growth spurt-thelarche-pubarche
D. Thelarche-pubarche-growth spurt-menarche

Answer: D

Solution

In girls, the sequence of changes in puberty : **Thelarche-pubarche-growth spurt-menarche.**

- Thelarche- breast development
- Pubarche- development of pubic & axillary hairs
- Growth spurt- peak ↑ in growth velocity
- Menarche- beginning of menstruation

Reference: Ghai 9th ed pg 60

LEARNING OBJECTIVES

UNIT 5: NEONATOLOGY

- Important terminologies of preterm and post term neonates
  - Important Terms used
  - Classification of neonates
  - Normal term neonate
  - Preterm neonate and its related issues
  - Post term neonate

- Primitive neonatal reflexes and some conditions not requiring treatment
  - Moro reflex
  - Some normal conditions in neonates
  - Difference btw cephalhematoma and caput succedaneum

- Latest updates in neonatology

12 IMPORTANT TERMINOLOGIES AND PRIMITIVE NEONATAL REFLEXES

INTRODUCTION

00:00:44

- Neonatal Period : 1st 28 days of life
- Early Neonatal Period: 1st 7 days of life
  - Day of birth to < 7 completed days
- Late Neonatal Period: D_7 – 28 days of life

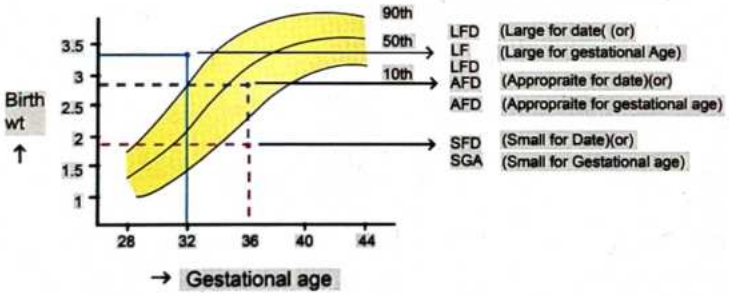
CLASSIFICATION

00:02:33

i. **According to Their Gestational Age (irrespective of birth weight)**
   1) Term: Born b/w 37 completed weeks to < 42 weeks of gestation
   2) Preterm: Born at < 37 weeks of gestation
   3) Post Term: Born at or beyond 42 weeks of gestation

ii. **According to Birth Weight (irrespective of gestational age)**
   1) LBW [low birth weight]: < 2500 grams Birth weight
   2) VLBW [Very low Birth weight]: < 1500 grams Birth weight
   3) ELBW [extremely low birth weight]: < 1000 grams Birth weight

iii. **According To Gestational Age & Birth Weight**



- SFD (or) SGA: Birth weight is < 10th percentile of expected, according to Gestational age (GA)
- AFD (or) AGA: Birth Weight is between 10th – 90th percentile of expected, according to gestational age
- LFD (or) LGA: Birth weight is > 90th percentile of expected, according to GA

IMPORTANT CAUSES FOR LFD NEONATE

00:15:48

1. Infant of diabetic mother
2. Congenital hypothyroidism
3. Constitutional/ familial cause
4. Soto's syndrome/ cerebral gigantism
5. Beckwith-wiedemann syndrome
   - Hemihypertrophy
   - Macroglossia
   - Increase risk of tumors (E.g. Wilms tumor etc)

NORMAL TERM NEONATE

00:19:26

- Birth weight of an average Indian baby: 2.8 kg (Ghai, 9th edition: 2.9 kg)
- Length: 50 cm
- US:LS ratio: 1.7 – 1.9:1
- HC: 33 – 35 cm
- Heart Rate: 120 – 140 bpm (110-160 bpm)
- Respiratory rate: 40 – 60/ min
- Peripheral cyanosis (Acrocyanosis) Normal finding
- Soft systolic murmur
- Abnormal findings
  - Central cyanosis at birth
  - Jaundice at birth/ D_1

Peripheral cyanosis

PRETERM NEONATE

00:23:36

ACOG	Born below
• Moderate preterm neonates	• 32-$33^{6/7}$ weeks of gestation or post menstrual age
• Late Preterm Neonates	• 34-$36^{6/7}$ weeks of gestation or post menstrual age

Risk Factors for Preterm Birth

00:25:30

Refer Table 12.1

Previous Year's Questions

Q. Criteria for "high risk" infants (AIIMS Nov 2019)

A. Working mother
B. Malpresentation
C. 100 folic acid tablets not taken during pregnancy
D. Pre-eclampsia

Characteristics of a Preterm Neonate

00:29:41

General	Head to Toe
1. Lesser subcutaneous fat • Appears emaciated 2. Generalized hypotonia • Extended posture 3. Skin • Thin, Translucent & Friable 4. Abundant lanugo but little vernix caseosa (Cheesy, white, sticky material present all over the body of the neonate)	1. Head appears relatively large 2. Anterior fontanelle: Large, wide-open  Anterior Fontanelle 3. Ear cartilage is poorly formed • Pinna is Soft & deformable 4. Breast buds < 5 mm size or impalpable 5. Genitalia • Male: Undescended testes and poorly formed scrotum which is smooth (has no rugosities) • Female: Labia majora widely separated, Labia minora is clearly visible 6. Absent deep creases on the sole

TOOL USED TO ASSESS GESTATIONAL AGE IN A NEONATE

00:37:10

- ENBS (Expanded New Ballard Score)
- Used for 20 - 44 week gestation
- Approximate gestational age of neonate: ± 2 weeks accuracy
- It can be used for neonates between 30 minutes to 96 hours of life, and may be useful upto D, of life.

Characteristics in Preterm Neonate

Smooth sole

Extended posture

Scarf sign

Popliteal angle

Neuromuscular Maturity

00:39:11

Refer Figure 12.1

Physical Maturity

00:44:10

Refer Table 12.2

- -10: minimum score
- 50: maximum score
- Ballard score is used for 20-44 weeks that is a wide range of gestational age.

Corrected Gestational Age (CGA)

00:46:28

- Used till 2 year age
- CGA = (GA + Postnatal age) – 40 weeks

- E.g. baby born at 32 weeks gestation currently 10 weeks old
  - CGA = (32 + 10) – 40
    = 42 – 40
    = 2 weeks

POST – TERM OR POST MATURE NEONATE

Physical signs of Post–Maturity 00:48:59

- Abundant hairs
- Desquamation, pale skin
- Long nails
- Loose skin folds around thighs and buttocks
- Meconium stained nails, skin or umbilical coral
- Presence of placental membranes.

Complications of Post-Maturity 00:50:51

- Perinatal asphyxia
- Polycythemia (due to fetal distress and hypoxia)
- PPHN (Persistent pulmonary hypertension of newborn)
- Meconium aspiration syndrome
- Hypoglycemia
- Hypocalcemia

Table 12.1

Maternal	Uterine	Placental	Fetal
• Previous preterm birth • Young or advanced age • Chronic medical illness (cardiac, renal) • Obesity • Short inter pregnancy interval • Infections (Group B strept., UTI, Chorioamnionitis) • Pre-eclampsia • Polyhydramnios • Premature rupture of membrane	• Bicornuate uterus • Incompetent Cervix	• Abruptio Placenta • Placenta Previa • Placental Dysfunction	• Fetal distress • Multiple Gestation • Erythroblastosis • Non-immune hydrops

Figure 12.1

Neuromuscular Maturity

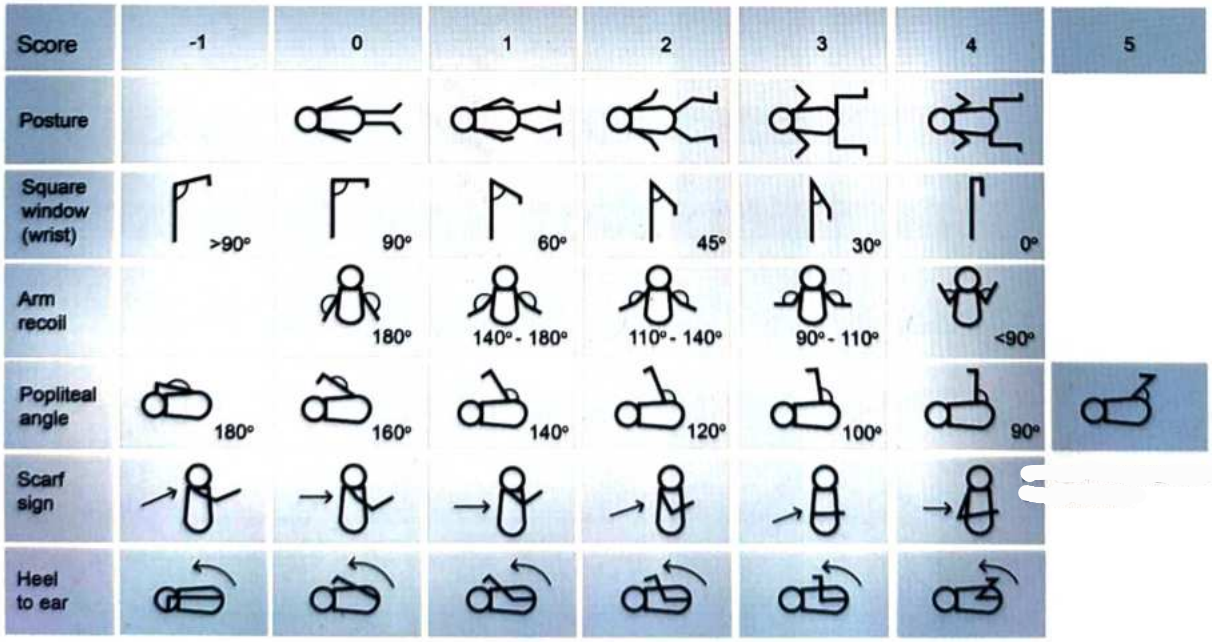


Table 12.2

Skin	Sticky friable, Transparent	Gelatinous, red, translucent	Smooth, pink; visible veins	Superficial peeling and or rash; few veins	Cracking, pale areas; rare veins	Parchment deep cracking; no vessels	Leathery, cracked wrinkled	
Lanugo	None	Sparse	Abundant	Thinning	Bald areas	Mostly bald	Maturity Rating	
Plantar Surface	Heal – toe 40-50 mm; -1 <40 mm:-2	> 50 mm no crease	Faint red marks	Anterior transverse crease only	Creases anterior 2/3	Creases over entire sole	Score	Weeks
							-10	20
							-5	22
							0	24
Breast	Imperceptible	Barely perceptible	Flat areola, no bud	Stippled areola 1-2 mm bud	Raised areola 3-4 mm bud	Full areola 5-10 mm bud	5	26
							10	28
							15	30
							20	32
Eye / Ear	Lids fused loosely -1 Tightly -2	Lids open Pinna flat Stays folded	Slightly curved pinna, soft, slow recoil	Well curved pinna; soft but ready recoil	Formed and firm instant recoil	Thick cartilage; ear stiff	25	34
							30	36
							35	38
							40	40
Genitals (male)	Scrotum flat, smooth	Scrotum empty, faint rugae	Testes in upper canal, rare rugae	Testes descending, few rugae	Testes down, good rugae	Testes pendulous, deep rugae	45	42
							50	44
Genitals (female)	Clitoris prominent, labia flat	Clitoris prominent, small labia minora	Clitoris prominent, enlarging minora	Majora and minora equally prominent	Majora large, minora small	Majora cover clitoris and minora		

CLINICAL QUESTIONS

Q. Identify this syndrome which carries increased risk of Wilms' tumor

A. WAGR syndrome
B. Sturge Weber syndrome
C. Denys-Drash syndrome
D. Beckwith-Wiedemann syndrome

Answer: D

Solution

This baby has hemihypertrophy of left side of body (compare left side with right side) & omphalocele

- These features are seen in Beckwith Wiedemann syndrome, in which increased risk of Wilm's tumor is seen.
  - Wilms tumor (WT), also known as nephroblastoma, is the most common primary malignant renal tumor of childhood.
  - WT is the second most common malignant abdominal tumor in childhood.

Syndromes associated with Wilms Tumor

Syndrome	Clinical Features
WAGR	Wilms tumor, Aniridia, genitourinary abnormalities, mental retardation
Denys Drash	Renal failure, male pseudohermaphroditism
Beckwith-Wiedemann syndrome	Organomegaly (liver, kidney, adrenal, pancreas) macroglossia, omphalocele, hemihypertrophy

Sturge-Weber Syndrome (SWS):

- **Angiomas involving leptomeninges** & skin of face, typically in ophthalmic & maxillary divisions distributions of trigeminal nerve.
- The **hallmark** of SWS is a **facial cutaneous venous dilation**, also referred to as a nevus flammeus or **port-wine stain**.
- **Contralateral focal seizures, calcification** of cerebral cortex and **glaucoma** on same side as skin lesions are seen

Reference: Nelson 20/e pg-2465-2467

Q. A woman delivered a baby of 2.2 kg weight. Her LMP is not known. To know the maturity of baby, all of the following are used EXCEPT?

A. Sole crease
B. Ear cartilage
C. Breast nodule
D. Weight of the baby

Answer: D

Solution

Expanded New Ballard Score (EBNS) - assess gestational age of a neonate.

It includes physical characteristics:

- skin of the baby
- sole crease
- ear cartilage
- breast nodule

Physical Maturity

	-1	0	1	2	3	4	5
Skin	Sticky friable transparent	gelatinous red, translucent	smooth pink, visible veins	superficial peeling &/or rash. few veins	cracking pale areas rare veins	parchment deep cracking no vessels	Leathery cracked wrinkled

13 PRIMITIVE NEONATAL REFLEXES

00:00:22

Present at Birth (Term)	Appears	Disappears
Rooting Reflex	32 weeks of gestation	Starts disappearing at 1 month post-natal age
Moro's Reflex	28 – 37 weeks	5 – 6 months
Palmar Grasp Reflex	28 weeks	3 months
ATNR [Asymmetric Tonic Neck Reflex]	35 weeks	5-6 months
Present After Birth	Appears	Disappears
STNR [Symmetric Tonic Neck Reflex]	4-6 months	8-12 months
Parachute Reflex	7-8 months	Persists throughout life
Landau Reflex		
Neck Righting Reflex		

Rooting Reflex

Asymmetric Tonic Neck Reflex

How to remember

- A comes before S
  - ATNR is present before birth.
  - STNR is present after birth.

Important Information

Q. Which primitive neonatal reflex helps mother in breast feeding: Rooting reflex

Q. Which primitive neonatal reflex is earliest to disappear: Rooting reflex

MORO'S Reflex/ Embrace Equivalent 00:05:16

- Components of a Complete Moro's Reflex:
  - Symmetric abduction & extension of UL along with opening of hands followed by Flexion & adduction of UL

[+]

↓

Extension of head & Trunk,
Movement of lower limbs,
Crying

- Also k\a Embrace Equivalent

Refer Table 13.1

- Abnormal persistence beyond 6 months indicates Cerebral Damage
- MORO'S Reflex: If once disappears, Never Reappears

Causes of Absent Moro's Reflex

- Stage -3 (severe) Hypoxic Ischemic Encephalopathy (HIE)
- Down's syndrome
- Acute Bilirubin Encephalopathy

Causes of Exaggerated Moro's Reflex

- Stage 1 (early/mild) Hypoxic Ischemic Encephalopathy

Causes of Asymmetric Moro's Reflex

- Neurological Causes
  - Erb's palsy [C5, C6 injury]
  - Congenital hemiplegia
- Skeletal Causes
  - Fracture clavicle
  - Shoulder joint dislocation

IMPORTANT CONDITIONS IN NEONATES NOT REQUIRING ANY SPECIFIC TREATMENT

00:25:41

Skin & Mucosa

1. **MILIA:** Colourless papules d/t plugging of sweat ducts

2. **Erythema Toxicum Neonatorum**

- Erythematous maculo papular rash mainly on trunk, seen in 1st week of life
- d/t immune phenomenon
- Biopsy shows Eosinophil filled sterile lesion

Erythema Toxicum

3. **Mongolian Spots**

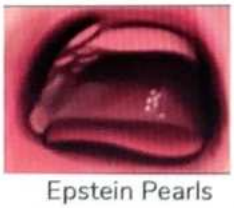
- Bluish black areas of discoloration
- Mainly on Lower back, buttocks, back of thighs d/t arrest of migration of neural crest cells

4. **Stork Bite/ Salmon Patch**

- Pinkish colored lesions capillary hemangiomas
- In between eyebrows/ nape of neck /forehead

5. **Epstein Pearls**

- Pearl like white lesions
- Hard palate involved
- Epithelial inclusion cysts



Epstein Pearls

6. **Acne Neonatorum:** d/t maternal androgen

7. **Subconjunctival Hemorrhages**

8. **Mastitis Neonatorum**

- B/L breast engorgement
- In male/ female neonates
- Day 2-3 of life
- D/t effect of maternal hormones

9. **Vaginal Bleeding**

- Seen in female Neonates
- On Day 3 - 5 of life
- Due to effect of withdrawal of maternal hormones

10. **Hymenal Tags:** Skin growth near the vagina opening

11. **Physiological Phimosis**

12. **Physiological Weight Loss**

- Term neonates lose upto 10% of birth weight in 3-5 days, Regained by D_{10} of life
- Preterm neonates lose upto 15% of birth weight in 7-10 days, Regained by D_{15} of life

13. **Cephalhematoma v/s Caput succedaneum** 00:40:14

Refer Table 13.2

Table 13.1

- Begins to appear — 28 weeks of gestation
- 1st component to appear — opening of hands
- Moro's reflex completely appears by — 37 weeks of gestation
- Disappears at — 5-6 months (Nelson) best answer is 6 months
  3-6 months (O.P. Ghai)

Table 13.2

Cephalohematoma	Caput Succedaneum
• Subperiosteal hemorrhage involving cranial bones	• D/t edema in the layers of scalp
 Does not cross sutures	 Can cross sutures
• May take 24 hours to appear completely	• Already present at birth in its maximum size
• Takes 5-7 weeks to disappear	• Disappears by 48-72 hours
• Predisposes to neonatal jaundice	• Does not predispose to neonatal jaundice
	

CLINICAL QUESTIONS

Q. Mother brings her an year old child to the dermatologist as soon as she notices a dramatic color change longitudinally into a pale upper half and a deep red dependent half when she laid down the child on one side. Which of the following is not incorrect statement about this color change?

A. The skin of entire body is typically reddish
B. Needs immediate hospitalisation
C. A Complication of Epidermolysis bullosa
D. Probably reflects an imbalance in the autonomic vascular regulatory mechanism

Answer: D

Solution

Harlequin color change: reflects an imbalance in the autonomic vascular regulatory mechanism.

- When the infant is placed on the side, the body is bisected longitudinally into a pale upper half and a deep red dependent half.
- Need no treatment

NOTE: Do not confuse it with **Harlequin ichthyosis.**

- **The newborn is covered**with thick patches **of skin that** crack and split. Thick**plaques** can pull and distort facial features and restrict breathing and food**intake.** Mutations in the ABCA12 gene.

Reference: Nelson Textbook of Pediatrics 21st ed. 13324

Q. A 9-month-old baby was born at 38 weeks, healthy & vigorous. Which amongst the following finding is/are seen in a healthy term infant?

A. Floppy infant
B. Asymmetric Tonic neck reflex
C. Parachute reflex
D. Moro's reflex
E. MacEwen sign

Answer: C

Solution

In a Healthy term infant, parachute reflex appears by 7-8 months & it never disappears.
Abnormal findings:

- Floppy infant- Hypotonia
- MacEwen sign/ Crackpot sign- Raised ICT

Moro's reflex and Asymmetric Tonic neck reflex disappear by 5-6 months postnatal age.

Reference: Nelson textbook of Pediatrics, 20th Ed, page 2796

14 NEONATAL RESUSCITATION

Neonatal Resuscitation Protocol 00:00:30

- Given by American Academy of Pediatrics (October 2015)
- 10% of neonates require some form of resuscitation at birth
- < 1% require chest compressions or medications

Protocol 00:02:24

Refer Flow Chart 14.1

Recommended Target O_2 Saturation 00:38:03

Age	Target saturation
1 minute	60-65%
2 minutes	65-70%
3 minutes	70-75%
4 minutes	75-80%
5 minutes	80-85%
10 minutes	85-95%

Hypovolemia

- Pale, Poor peripheral perfusion, feeble pulses
- Rx by fluids
  - Normal saline [Fluid of choice]
  - group Rh negative blood
  - Ringer lactate no longer recommended

Important Information

- Suction of Airways: Mouth always followed by Nose
- Usual size of suction catheter: 12 or 14 f
- Usual pressure of suction: 80 mmHg or 100 cm H_2O [never > 100mm of Hg]

Recommended temp. of delivery room: 25° c

- **CPAP:** Continuous Positive Airway Pressure
- **PPV:** Positive Pressure Ventilation (Bag & mask ventilation)
- **Team Debriefing:** Question the team members how well they followed the protocol so that they do even better in next time
- Post Resuscitation Care
  - Start I.V fluids
  - Start monitoring the condition of the patient
  - Maintain normal temperature
  - Maintain normal glucose
  - Treatment according to the condition of the baby

Previous Year's Questions

Q. Correct order of suctioning during neonatal resuscitation is? (AIIMS May 2018)

A. Trachea-nose-mouth
B. Nose-mouth
C. Mouth-nose-trachea
D. Mouth-nose

Positive pressure ventilation 00:39:46

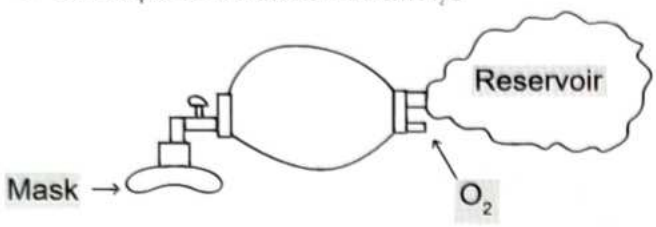
- Device used: Self inflating bag & mask ['AMBU' BAG]

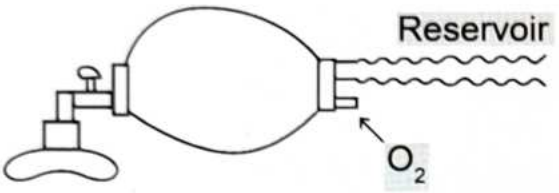
- Function of reservoir: ↑ O_2 delivered to baby
- Oxygen delivery depends on O_2 supply & Reservoir

O_2 supply	Reservoir	FiO_2 delivered
-	-	21%
+	-	40%
+	+	90-100%

- Starts with room air (fio_2 21%) in term neonates
- Babies born at < 35 weeks of gestation: 21-30% fio2

- Rate at which PPV done: 40-60 breaths/min
- Pressure required to deliver breath to neonate
  - 1st breath: 30-40 cm H_2O
  - Subsequent breaths: 15-20 cm H_2O





Important Information

- **Absolute C/I to bag & mask ventilation Congenital Diaphragmatic Hernia**
- **Reason: Air goes into the esophagus, stomach and intestines. The bowel expands and the lungs are compressed leading to respiratory compromise**

CXR findings in congenital Diaphragmatic hernia

- Bowel gas shadows in thorax
- Mediastinal shift
- Pulmonary hypoplasia

- Initiation of PPV is the single most important step in neonatal resuscitation

Previous Year's Questions

Q. Most important indicator of successful neonatal resuscitation. (AIIMS MAY 2019)

A. Color change
B. Improved air entry
C. Increase in heart rate
D. Bilateral chest movements

Ventilation corrective steps 00:56:07

- Ensure
  - Mask is of appropriate size
  - Seal between mask & face should be tight (E-C Clamp Technique)
  - Head of baby should be slightly extended (to keep airway open)
  - Mouth kept slightly open

Endotracheal intubation in NRP 01:00:03

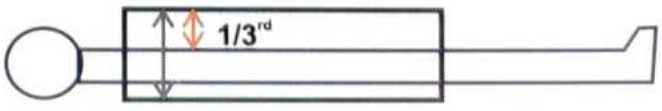
- Laryngoscope (neonatal)
  - With straight blade
  - Size 0 in preterm neonate
  - Size 1 in Term neonate
- Endotracheal Tube Size

Birth weight	Gestational age	Size of ET (mm)
< 1000 g	< 28 weeks	2.5 mm
1000-2000 g	28-34 weeks	3 mm
> 2000 g	> 34 weeks	3.5mm

- Ways to Confirm Whether Endotracheal Tube is in Trachea
  - B/L visible chest rise with each breath
  - Improvement in vital parameters (H.R, Color, spo_2)
  - B/L audible breath sounds in chest
  - Misting of ET tube with each breath (due to water vapours in expired air)
  - $ETCO_2$ determination [end tidal CO_2] or Capnography: Recommend method to know whether ET is in Trachea]
- CXR-AP view is not useful for confirming ET tube is in trachea
  - It is useful to know the level of ET Tube
- Tip of ET Tube should be at lower border of body of 2nd thoracic vertebra in children

Chest Compressions 01:09:43

- **Site**: In the midline, on the lower 1/3rd of the body of sternum (or)
  - In the midline, just below the line joining 2 nipples
- **Technique**: 2 Thumb - Encircling Technique is Preferred over 2 Finger Technique
  - Higher pressure generated
  - Better perfusion
  - Lesser rescuer fatigability



- **Depth:** 1/3rd of A.P Diameter of chest
- **Ratio of Chest Compressions:** PPV → 3:1 [90 chest compressions of 30 breaths in 1 minute]
  - In 2 seconds: 3 C.C + 1 Breath

Injection adrenaline 01:17:05

- **Dose:** 0.01 mg/kg/ dose, upto 3 times (0.01-0.03 mg/kg)

or

0.1 ml/kg/dose of 1:10,000 Adrenaline

- **1:10,00:** Strength/ concentration of Adrenaline recommended in NRP
- **Preferred Route:** Intravenous through umbilical venous catheter
- Can be given intratracheally (0.05-0.1 mg/kg/dose), if not able to secure a vascular access

RESUSCITATION OF A BABY BORN THROUGH MECONIUM STAINED LIQUOR (MSL) 01:20:39

Previous recommendations:

Baby born through MSL

↓

Assess

Vigorous Neonate	Non-Vigorous Neonate
1. HR > 100/ min	1. Do Not Stimulate
2. Good muscle tone	2. Put the baby under a warmer
3. Strong respiratory effort	3. Do ET intubation & tracheal suction to remove meconium
Proceed as per NRP	↓ Proceed as per NRP
	4. Intra partum suction of mouth & nose (when only head of the baby has delivered), no longer recommended

Latest Recommendations 01:26:16

- Routine ET intubation & tracheal suction of all non-vigorous neonates born through MSL is no longer recommended
- Ensure, at least 1 person, skilled in ET intubation is available at the time of resuscitation

Conditions in which do not resuscitate a neonate 01:29:48

1. Anencephaly
2. Confirmed case of Trisomy 13 (Patau syndrome)
3. Gestational Age < 22 weeks

Important Information

- New Born Care Corner (NBCC) Should Be Available At All Health Facilities Where Childbirth Is Taking Place

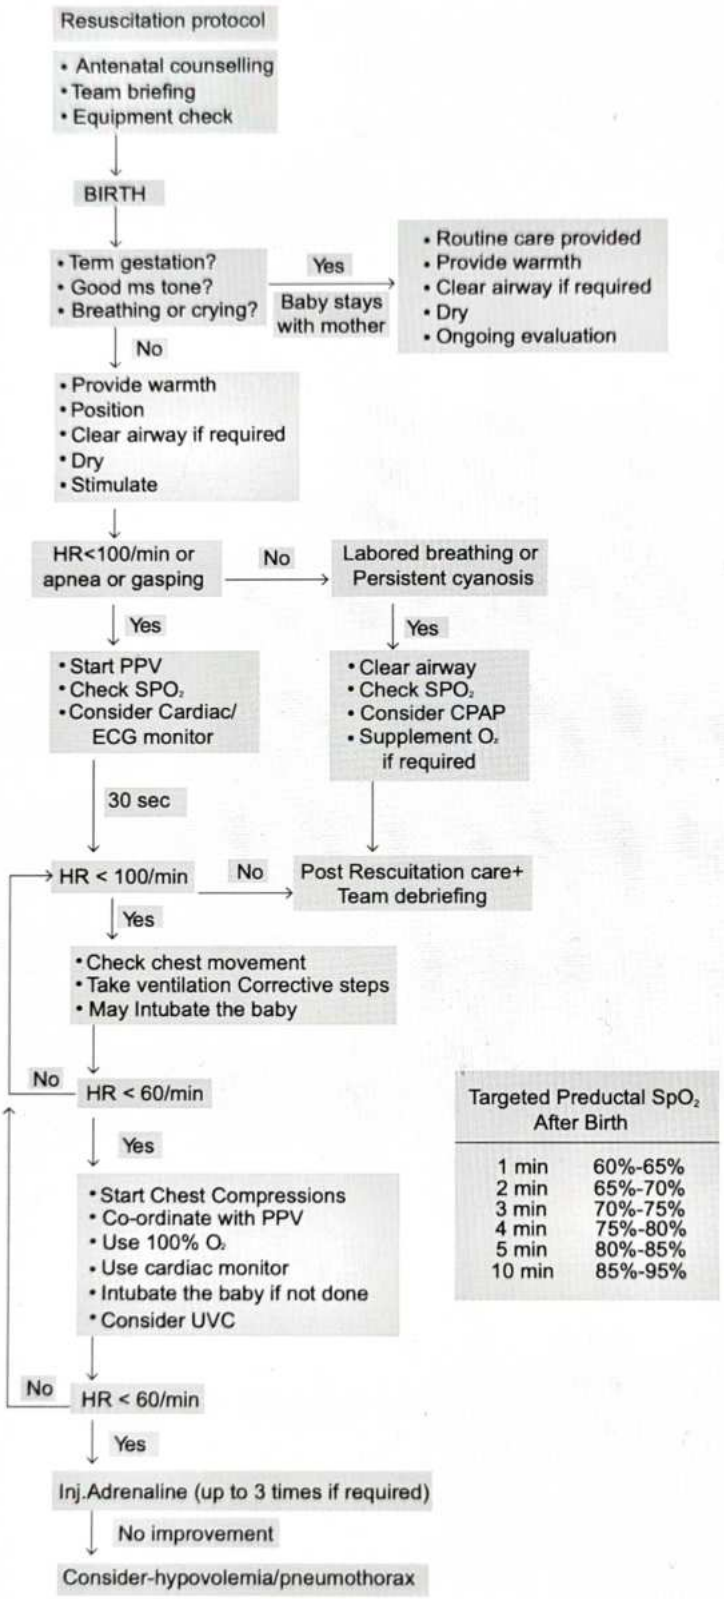
DELAYED CORD CLAMPING 01:33:50

- Wait for at least 30 seconds before clamping umbilical cord
- Recommended for all stable, term & preterm neonates
- **Advantages**
  - Lesser chances of Anemia
  - Lesser need of blood transfusion
  - Higher B.P (lesser chances of shock/hypotension)
  - Lesser risk of NEC (Necrotizing colitis)
  - Lesser risk of IVH (Intraventricular hemorrhage)
- **Disadvantage:** slightly ↑ risk of neonatal jaundice
  - A single dose of inj vit K_1- 1 mg, Intramuscular for all babies, at birth to prevent 'Hemorrhagic Disease of New Born'
    → (If Birth Weight < 1 KG, Then Dose of Vit. K: 0.5 mg)
  - Early Initiation of Breastfeeding: within 1 hour of childbirth
  - Maintain Normal Temperature of the Baby: 36.5° C – 37.5° C
  - Record Weight of the Baby

Before Discharge 01:40:26

- Immunization: B.C.G, O.P.V, HEP-B
- Screening for diseases
- Screen for jaundice
- Vit. D supplementation (400IU/day) and continued throughout first year of life.

Flow Chart 14.1



Targeted Preductal SpO_2 After Birth	
1 min	60%-65%
2 min	65%-70%
3 min	70%-75%
4 min	75%-80%
5 min	80%-85%
10 min	85%-95%

UVC-Umbilical venous catheterization
-Vascular access of choice during neonatal resuscitation

15 IUGR AND FEEDING OF PRETERM NEONATE

DISEASES OF NEWBORN

00:00:23

More commonly seen in

Preterm	SGA/ IUGR	Preterm/SGA/ IUGR

• Neonatal sepsis
• **CNS:** intraventricular hemorrhage
  ○ Area commonly involved: Germinal matrix
• **Eyes:** ROP (Retinopathy of Prematurity)
• **Respiratory system**
  ○ Respiratory distress syndrome [Hyaline membrane diseases]
  ○ Pulmonary hemorrhage
  ○ BPD (Bronchopulmonary dysplasia/ chronic lung diseases)
  ○ Apnea of prematurity
• **CVS**
  ○ PDA (Patent ductus arteriosus)
• **GI**
  ○ Feeding issues
  ○ NEC (Necrotizing enterocolitis)
  ○ Neonatal jaundice
• Anemia of prematurity
• Osteopenia of prematurity
	• Polycythemia
	• Persistent Pulmonary Hypertension of Newborn (PPHN)
	• Meconium aspiration syndrome
		• Hypothermia
		• Hypoglycemia
		• Hypocalcemia
		• Perinatal asphyxia (hypoxia)

SGA (Small for gestational age)

00:11:50

- Birth weight < 10th percentile of expected according to the gestational age.

IUGR (INTRAUTERINE GROWTH RESTRICTION)

- It is a clinical definition
- Refers to all babies with clinical features of malnutrition or undernutrition like
  - ≥ 3 loose skin folds in buttock region
  - Emaciated appearance, Peeling of skin

Important Information

- All SGA babies are IUGR, but all IUGR babies may not be SGA
- Morphological IUGR
  - Babies with clinical features of malnutrition, but birth weight between 10th – 25th percentile of expected
  - So, this baby is Not SGA

Symmetric & Asymmetric IUGR

00:17:00

	Symmetric IUGR	Asymmetric IUGR
1. Time of Insult	• 1st trimester or early 2nd trimester	• Later 2nd or 3rd trimester
2. Usually etiology	• Genetic • Torch infections	• Maternal undernutrition • Hypertension • Anemia
3. Effect on cells	• No. of cells is ↓	• Size of cells are mainly affected

CLINICAL QUESTIONS

Q. A 29 yr old primigravida, POG 30 weeks was rushed to the hospital after she complained of leakage per vaginum. On reaching the hospital, her vitals were checked as, BP: 90/100, pulse: 62, temp: 38°C. FHS was sluggish & and she was taken to the LR after strong contractions started, NVD done. Baby handed over to the pediatrician. Birth weight of baby- 900 gms, bradycardia, apenic, decreased activity, poor muscle tone & bulging anterior fontenella. On USG head, the ventricles were swollen with the presence of blood. By what ways can this be not prevented?

A. Antenatal steroid use
B. Minimal & gentle handling
C. Avoiding rapid boluses of hyperosmolar solution
D. Avoiding high FiO_2 during mechanical ventilation

Answer: D

Solution

Ways to prevent intraventricular hemorrhage in a preterm neonate:

- Antenatal steroid use
- Minimal & gentle handling
- Avoiding rapid boluses or infusion of hyperosmolar solution
- Avoiding **high pressures** during mechanical ventilation

Reference: Ghai 9th ed pg 159

Q. Following the birth of the baby pediatrician takes charge of the baby and begins with the resuscitation process in order to clear the airway for the baby to be able to breath. Suction pressure should not exceed what mm of Hg while suctioning the airway of neonates during neonatal resuscitation?

A. 50 mm
B. 80 mm
C. 100 mm
D. 130 mm

Answer: C

Solution

- Suction pressure should be kept nearby 80 mm Hg or 100 cm H2O
- It **should not be more than 100 mm Hg or** 130 cm H2O

Reference: Ghai 9th ed pg 129

4. Anthropometric parameters	• Head circumference, Length, weight Equally affected	• Head circumference is usually normal • length is less affected than weight
5. Ponderal index (P.I) ↓ $\frac{\text{Weight (g)}}{\text{Length (cm)}^3} \times 100$	• ≥ 2	• < 2 • Better prognosis

- **IUGR fetuses do not attain their intrauterine growth potential.**

IMPORTANT CAUSES OF IUGR

00:23:14

Maternal Factors	Placental	Fetal
• Underweight mother • Chronic disease • Autoimmune disease • Thrombotic disease (SLE) • Excess caffeine intake • Alcohol / Smoking • Radiation exposure • Teratogen exposure • Uterine anomalies	• Malformation • Infarction • Abruptio placenta • Placenta previa	• Constitutional /familial • Chromosomal anomalies • Congenital malformations • Congenital infection • Multiple gestation

Prevention of IUGR

00:26:13

- Balanced energy/ protein supplementation is associated with 30% reduction in risk of IUGR.
- Antiplatelet agents: a/w 10% reduction in risk of IUGR
- Anti-oxidants (Vit. C & Vit. E): No reduction in risk of IUGR

ROP (RETINOPATHY OF PREMATURITY)

00:28:30

Risk Factors

1. Prematurity
2. Use of high concentration of O_2
3. Hemodynamically instability

Important Information

Q. When to screen for ROP for the 1st time?

- At 32 weeks. PMA (Post menstrual age) or 4 weeks postnatal age, whichever is later.

Example

1. LMP: 26 weeks of gestation + 4 week → 30 weeks (No) PMA → 32 weeks (Yes). Therefore will do screening for ROP 6 weeks after birth, for this baby
2. LMP: 30 weeks of gestation + 4 weeks → 34 weeks (Yes) PMA: 32 weeks (No)

Therefore, will do screening for ROP 4 weeks after birth.

Important Information

Q. Baby born at 28 weeks of gestation, is now 2 weeks old: how much time later will you screen for ROP?

- LMP: 28 weeks + 4 week's → 32 weeks from LMP
- PMA: 32 weeks
- So, 4 weeks later you will do screen for ROP but baby is already 2 weeks old
- Therefore 4 weeks – 2 weeks → 2 weeks

So, in this baby screening for ROP will be done 2 weeks later.

FEEDING OF A PRETERM NEONATE

00:36:23

- Based on gestational age we decide, the preferred initial mode of feeding

Gestational age	Preferred initial mode of feeding	Reason
< 28 weeks	• IV fluids ± TPN (total parenteral nutrition)	• Gut is too immature
28-31 weeks	• Orogastric tube feeding [gavage feeding]	• Gut is matured but rooting reflex is not developed
32-34 weeks	• Katori spoon feeding or paladai feeding	• Coordination between swallowing & breathing not well developed
> 34 weeks	• Direct breastfeeding	

- **Trophic feeds:** Can be started even before 34 weeks of gestation if the baby is hemodynamically stable. Here, minimal amounts of orogastric feeding is allowed. It helps in increasing gut immaturity.
- **Nonnutritive feeds:** Babies less than 34weeks of age can be put to feed on breasts. They may or may suck but it helps in increasing milk production and output.

16 NEONATAL SEPSIS

Definition 00:01:29

A clinical syndrome characterized by signs and symptoms suggestive of systemic neonatal infection with or without bacteremia.

Classification

- Early onset sepsis (EOS)
- Late onset sepsis (LOS)

EARLY ONSET SEPSIS 00:02:15

- Onset usually within within 1st 72 hrs of life
- Organisms responsible are usually derived from maternal genital tract like Group B streptococci, E.Coli.

Risk factors

- **Mother**
  - Foul smelling liquor
  - Premature rupture of membranes (≥ 24 hours prior to delivery)
- **Delivery**
  - Difficult/ prolonged labour (1st and 2nd stage duration > 24 hours)
  - Multiple Per-Vaginal examination (single nonsterile / ≥ 3 sterile examinations)
- **Baby**
  - Low Birth Weight
  - Prematurity
  - Perinatal asphyxia

LATE ONSET SEPSIS 00:05:22

- Organisms acquired from environment
- Community acquired (baby staying at home)
  - Staphylococcus aureus
  - E. coli
- Hospital Acquired (baby in hospital)
  - Acinetobacter
  - Klebsiella

Important Information

- Meningitis is commonly associated with LOS

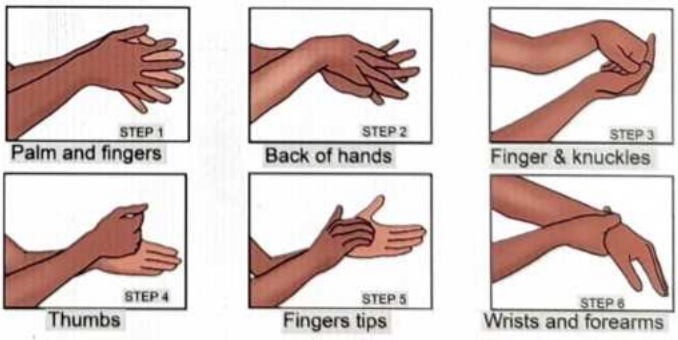
Risk Factors

Nosocomial	Community acquired
Prematurity	Poor hygiene
NICU admission	Poor cord care
Invasive procedures	Bottle feeding
Mechanical ventilation	Lack of breastfeeding
Use of stock solutions	Pre lacteal feeds

Important Information

- Exclusive breastfeeding helps in prevention of neonatal sepsis.
- Most Effective/ Important Method to Prevent Neonatal Sepsis
- Proper Hand Washing of Care givers for At Least 2 Minutes (6 Steps)

6 Steps of Hand washing



MOST COMMON ORGANISM RESPONSIBLE FOR NEONATAL SEPSIS 00:12:37

In India	Acinetobacter > klebsiella
In hospitals in India	Acinetobacter > klebsiella
In hospitals across the world	E. coli

Early onset sepsis (world)	Group B- streptococcus
Overall throughout the world	Group B- streptococcus

Clinical Features 00:14:42

- Poor feeding or alteration in established feeding behaviour (earliest manifestation)
- Temperature disturbances (Hypothermia > fever)
- Metabolic: Hypoglycemia, metabolic acidosis
- CNS: Shrill cry, irritability, seizures, abnormal posturing
- Respiratory: Tachypnea, hypoxia, respiratory distress
- GI: Abdominal distension, feed intolerance
- Severe sepsis
  - Septic shock
  - Multiple organ dysfunction
  - DIC: Bleeding
  - Sclerema: Generalized, non-pitting edema seen in neonates with severe sepsis/ severe hypothermia

Diagnosis 00:17:18

- Definitive Test (gold standard): Blood Culture
- Screening Test: Sepsis Screen

Sepsis Screen

- Components → Any 2 out of 4 → +ve sepsis screen

1. ANC (Absolute Neutrophil Count) → < 1800/mm^3
   - ANC cutoff
     → For term neonates: Manroe's charts
     → For VLBW neonates: Mouzinho's charts
2. I-T ratio [Immature: Total neutrophil]: >0.2
3. Micro ESR: >15 mm
4. CRP [C-Reactive Protein]: > 1mg/dl

- Positive sepsis screen has
  - Sensitivity= 90-100%
  - Specificity= 80%
  - Positive predictive value = 25%
  - Negative predictive value = 99-100%

Supportive Tests

- Blood glucose
- CXR
- Lumbar puncture & CSF study (in all cases of LOS and cases of EOS with neurological features)

Treatment 00:23:20

- **Supportive Care**
  - Shift to Nursery/ NICU
  - Start IV fluids
  - Maintain normal temperature (36.5- 37.5 degrees)
  - Maintain euglycemia
  - Maintain normal oxygen saturation
- **Specific Treatment**
  - I.V. broad Spectrum Empirical antibiotics
  - Indications
    → **EOS**
    - Foul smelling liquor
    - ≥ 3 risk factors for EOS
    - <3 risk factors + clinical features suggestive of neonatal sepsis and +ve sepsis screen
    - Strong clinical suspicion of EOS

    → **LOS**
    - +ve sepsis screen
    - Strong clinical suspicion

Which antibiotics?

- Inj. Ampicillin + inj. Gentamicin
  +
  Inj. Cefotaxime (3rd generation cephalosporin), if meningitis present or suspected

Duration of antibiotic therapy

Sepsis screen	Blood culture	CSF S/O meningitis	Duration of Antibiotics
-	-	-	3 days
+	-	-	1 week (7-10days)
±	+	-	2 weeks
+/-	+/-	+	3 weeks

CLINICAL QUESTIONS

Q. A term neonate is brought to the pediatric emergency with a history of not feeding well for last 6 hours. On probing, there was a history suggestive of chorioamnionitis and premature rupture of membrane in the mother. Which of the following should be the best approach to manage this baby?

A. Start IV antibiotics immediately, after taking a sample for blood culture.
B. Start oral antibiotics and monitor for worsening of clinical condition
C. Reassure and do nothing
D. Monitor the baby and start IV fluids only

Ans: A

Solution

Perinatal risk factor + sepsis symptoms in baby- **Start IV antibiotics immediately, after taking a sample for blood culture**

Reference: Ghai 9th ed pg 161

Q. A neonate was admitted in the NICU for low birth weight and respiratory distress. After a week of child's birth, he develops features like poor feeding, hypothermia, tachypnea worsens and abdominal distension. All these features indicate sepsis. What is the definitive test for it's diagnosis?

A. Blood culture
B. Urine culture
C. Immature:Total neutrophil ratio
D. Sepsis screen

Ans: A

Solution

Blood culture: gold standard/definitive test for diagnosis of neonatal sepsis

- It is performed in all cases of suspected sepsis prior to starting antibiotics

Screening test for diagnosis of neonatal sepsis: Septic screen

Sepsis screen includes

- Total leukocyte count (TLC) < 5000/mm3
- Absolute Neutrophil count (ANC) < 1800/mm3
- Immature to total neutrophil (IT) ratio > 0.2
- Micro ESR > 15 mm in 1st hour
- C Reactive protein (CRP) positive: >1mg/dL

If any 2 out of following 5 present, sepsis screen is said to be positive.

Reference: Ghai 9th ed pg 160

17 NEONATAL HYPOTHERMIA

- Normal axillary temperature of a neonate = 36.5-37.5 degrees

Definition 00:01:09

- Axillary temperature of a neonate < 36.5° C
- It is measured using digital thermometer.

Ways by which temperature of a neonate is assessed

- Digital thermometer (kept in axilla for 3 minutes)
- Thermister probe (when baby is in radiant warmer/ incubator)
- Touch method (crude way): Touch the abdomen and palms and soles of baby

Abdomen	Palms and soles	Interpretation
Warm	warm	thermal comfort
Warm	cold	cold stress
Cold	cold	hypothermia

Classification

Category	Axillary Temperature
Cold stress	36– 36.4° c
Moderate hypothermia	32– 35.9° c
Severe hypothermia	< 32° c

Thermoneutral environment 00:08:25

- Range of environmental temperature at which a baby has minimum BMR (Basal Metabolic Rate), least O2 requirement and still the baby is able to maintain a normal body temperature.
- Varies by gestational age and postnatal age.
- E.g. term neonate (> 2500 gm)
  - Between day 1-2 of life-33 degrees
  - ≥3 days of life-32 degrees
- Ideally, all babies should be kept in a thermoneutral environment so that all the energy is used for growth of baby.

How frequently should the temperature of a baby be monitored?

- Stable term neonate: once/day
- Birth weight (1500-2499gm): 2 times/day
- < 1500 gm: 4 times/day
- Sick baby: 1-2 hourly

Why is Hypothermia more common in neonates?

- Larger surface area as compared to their body weight
  - More heat loss
  - Maximum heat loss takes place from head of a neonate
- Lesser subcutaneous fat especially in preterm/ SGA
- Vulnerability to get exposed
- Shivering is absent in neonates

Ways by Which Neonates Protect Themselves Against Hypothermia 00:16:58

1. Non-Shivering Thermogenesis: most important
- d/t the presence of Brown fat (lipid deposits rich in mitochondria)
- Areas richer in brown fat are
  - Axilla
  - Groin
  - Nape of neck

Mechanism

Baby exposed to cold environment
↓
Sympathetic stimulation
↓
Release of Norepinephrine
↓
Uncouples β oxidation of Fat
↓
Heat generated

2. Cutaneous Vasoconstriction: when exposed to cold temperature
3. Flexed Posture
4. Higher Heart Rate in Neonates (120-140 bpm): more cardiac output -more oxygenation of blood- more respiration- more heat generated.

Clinical features 00:23:27

- **Early:** due to peripheral vasoconstriction-pallor, acrocyanosis, decreased peripheral perfusion, cool extremities, irritability

- **Late:** bradycardia, lethargy, apnea, poor feeding, abdomen distension, weak cry, emesis, respiratory distress (due to increased pulmonary arterial pressure)

- **Prolonged hypothermia:** hypoglycemia, metabolic acidosis, hypoxia, coagulation abnormalities, PPHN, ARF

Prevention/ Treatment 00:28:04

i. Warm Chain to prevent Neonatal Hypothermia

- Thermal care in delivery room
  - Ideal temperature in delivery room 25°C -28° C
  - Delivery room should be free from drafts of air

- Warm resuscitation (NBCC should have at least 1 radiant warmer)
- Immediate drying
- Skin to skin contact
- Early initiation of breastfeeding
- Bathing postponed

- Rooming in
- Bedding in and appropriate clothing of baby

- Warm transportation (the weakest link)
- Training & awareness

Important Information

- **Ideal temperature in NICU - 22-26 degrees**

ii. Thermal care of a preterm neonate

- Use of polythene, food grade bags, just after the baby is born, before drying and shifting to a warmer/incubator to prevent evaporative heat loss.

- Incubator is preferred for preterm babies <32 weeks gestation (lesser insensible water losses and decreased evaporation)

- Servo mode is preferred

- In preterm neonate born at <28 weeks, initial humidification up to 80% in first week of life to minimize the heat losses due to evaporation.
  - Done in an incubator
  - Water compartment must be cleaned and dried daily (to prevent pseudomonal infection)

iii. Devices Used

Radiant Warmer (open care system)	Incubator (closed system)
	
Most important mechanism by which baby gets heated	
Radiation	**Convection**
Most important mechanism by which heat loss occurs	
• Convection: prevented by cling wraps • Modes **1.Servo method:** heater output is guided by body temperature of baby ○ **Disadvantage:** If probe gets displaced, baby can get overheated. **2.Manual:** preferred in ○ Procedures ○ Initial heating ○ Fever	Radiation

iv. Kangaroo Mother Care (KMC) 00:45:51

- Skin to skin contact between the baby & mother (caregiver)

- **Indication:** For all stable LBW babies except sick/<1200gm- Can be withheld during initial few days of life and then started.

- **Components**
  - **Kangaroo position:** Skin to skin contact
  - **Kangaroo nutrition:** Exclusive breast feeding
  - Early discharge from hospital and follow up.

- **Advantages**
  - Lesser risk of hypothermia
  - Lesser risk of nosocomial sepsis
  - Lesser risk of neonatal mortality
  - Shortens length of hospital stay
  - Higher exclusive breastfeeding rates
  - Better growth of the baby

Important Information

- **Minimum duration of KMC= 1 hour per session**

Treatment of Neonatal Hypothermia

- Cold stress
  - Remove wet clothes
  - Cover adequately
  - Warm environment
  - Skin to skin contact
  - Exclusive breastfeeding
  - Monitor temperature of baby frequently

Moderate Hypothermia

- Treatment of cold stress + extra heating source (radiant warmer/incubator/room heater)

Severe Hypothermia

- Initial rapid rewarming till 34 degrees f/b slow rewarming till 36.5 degrees
- Take measures to decrease heat loss
- Start IVF - 10% dextrose
- O2 if needed
- Injection vit. K
- If not improving: look for and treat neonatal sepsis

Important Information

- Temperature of non-asphyxiated neonates is a strong predictor of neonatal mortality at all gestational ages.

NEONATAL HYPERTHERMIA

00:57:43

Definition

- Axillary temperature >37.5 degrees in a neonate

Etiology

- Too hot temperature
- Too many clothes
- Dehydration
- Sepsis

Clinical features

- Early: hot flushed skin, irritability, tachycardia, tachypnea
- Late: lethargy, seizures, shock

Treatment

- Keep the baby in a room with temperature 25-28 degrees, away from any heat source
- Undress/remove any extra clothing
- Continue frequent breast feeding
- If temperature >39 degrees, do sponging with water at room temperature (tap water)

CLINICAL QUESTIONS

Q. An intern was assisting a C-section for the first time during her rotation in Gynecology department. A 30 yrs old multigravida gave birth to a large for age baby, the curious intern asked the senior doctor that which factor prevents newborn to suffer from hypothermia?

A. More body surface area
B. Lesser subcutaneous fat
C. Larger head size compared to rest of the body
D. Brown fat

Ans: D

Solution

- Presence of brown fat is a protective mechanism (non shivering thermogenesis) against hypothermia in newborn babies
- Infants have more body surface area as compared to adults which make them prone to heat loss. In particular, head size has the largest body surface area in the entire body
- In low birth weight and preterm infants, the insulating layer of subcutaneous fat is thin which also makes them prone to hypothermia

Reference: Nelson 20th e, p 798

Ques No: 2,QuesID : 43096
Subject: Pediatrics
Topic: Neonatology
Sub-Topic: Neonatal hypothermia

Q. A preterm neonate with birth weight of 1200 grams having hypothermia which is managed by skin to skin contact with the mother or by frequent feeding, is classified as moderate hypothermia as the temperature is ____. The temperature is recorded from the axillary area.

A. < 34 degree C
B. 31-34 degree C
C. < 32 degree C
D. 32-35.9 degree C

Ans: D

Solution

Classification of Neonatal hypothermia:
Cold stress: 36.0 - 36.4°C
Moderate hypothermia: 32 – 35.9°C
Severe hypothermia: < 32°C.

Reference: Ghai 9th ed pg 143

18 NEONATAL HYPOGLYCEMIA

Definition

- Blood glucose < 40 mg/dl or plasma glucose < 45 mg/dl
- According to WHO: blood glucose <45mg/dl

High Risk Neonates for Hypoglycemia 00:01:56

- SFD (small for date)/IUGR/Preterm
- Large for date neonates /infant of diabetic mother
- Neonatal hypothermia
- Neonatal sepsis

Important Information

- **Regular blood glucose monitoring is recommended in high risk neonates at regular intervals (2 hours, 6 hours, 12 hours, 24 hours, 48 hours, 72 hours of life)**
- **Blood glucose values are lowest b/w 1-3 hours of life.**

Clinical features 00:05:25

- Jitteriness> Tremors (most common)
  - Jitteriness stops on holding the limb but seizures do not.
- Neonatal seizures
- Lethargy
- Poor feeding
- Apnea, cyanosis
- Stupor, coma
- Increased sweating
- Sudden pallor
- Cardiac arrest

Treatment 00:07:11

Symptomatic

- IV 10% dextrose @ 2ml/kg stat bolus
  ↓
  Continuous IV fluids (@ GIR of 6 mg/kg/min)
  ↓
  Monitor blood glucoses and titrate GIR according to Blood Glucose value (GIR= glucose infusion rate)

Asymptomatic

- BG < 20 mg/dl → start IVF @ GIR of 6ml/kg/min – continue blood glucose monitoring and titrate GIR according to blood glucose levels
- BG 20 – 40 mg/dl
  - Offer a feed to baby & recheck Blood Glucose after ½ hour– 1 hour
  - **Case 1**: Blood Glucose still low → start IVF @ GIR of 6ml/kg/min – continue blood glucose monitoring and titrate GIR according to BG value
  - **Case 2**: Blood Glucose is normal → Continue frequent feeding & Blood Glucose monitoring

Important Information

- **Maximum dextrose concentration that can be given via a peripheral access =12.5%**

PERSISTENT HYPOGLYCEMIA 00:12:32

Endocrine Causes

- Congenital hypopituitarism
- Congenital adrenal insufficiency
- Congenital hyperinsulinemia (or) Nesidioblastosis (or) PHHI (Persistent Hyperinsulinemic hypoglycemia of Infancy)
  - It is mcc of persistent hypoglycemia during infancy
  - Drugs used in Rx
    → Octreotide (s/c injection)
    → Diazoxide
    → Glucagon
    → Nifedipine
  - Surgery in focal cases

Metabolic Causes

- Glycogen storage disorders [eg- von gierke disease aka type-I GSD]
- Galactosemia
- Hereditary fructose intolerance
- Mitochondrial disorders
- Fatty acid oxidation defect

INFANT OF DIABETIC MOTHER 00:19:18

- Complications and congenital malformations are more in babies born to mothers with pre-existing diabetes than those with GDM.

- **Pathophysiology**

Pederson's Maternal Hyperglycemia/ Fetal Hyperinsulinemia Hypothesis

Maternal Hyperglycemia

↓

Fetal Hyperglycemia

↓

Hyperplasia and hypertrophy of fetal pancreatic beta cells

↓

Fetal hyperinsulinemia → Neonatal Hypoglycemia

↓

Insulin acts as a Growth Factor for Fetus

Macrosomia/ LFD	↑Ed extra medullary Hematopoiesis	RDS in infant
• All organs ↑ in size in IDM except brain • Hairy pinna +nt in IDM	• Polycythemia • Neonatal Hyperbilirubinemia	• insulin inhibits cortisol mediated maturation of surfactant

Problems in IDM 00:26:40

- **Macrosomia/ Large for Date Baby**
  - Difficult/ prolonged labour
  - ↑ed chances of birth trauma
    → Perinatal asphyxia/HIE
- **Metabolic**
  - Hypoglycemia: presents in 1st 24 hours
  - Hypocalcemia
  - Hypomagnesemia presents later
  - Polycythemia
  - Neonatal jaundice
- **CVS:** increased risk of CHD
  - Mc congenital abnormality in IDM: C.H.D (Congenital heart disease)
  - Mc congenital heart disease in IDM: V.S.D
  - Most specific congenital heart disease in IDM: TGA (Transposition of great arteries)
- **Respiratory System**
  - More chances of RDS due to delayed maturation of surfactant
- **CNS**
  - Mc congenital neurologic abnormality in IDM: Neural tube defects
  - Most specific neurologic abnormality in IDM: Sacral agenesis or caudal regression syndrome.
  - Overall most specific congenital abnormality in IDM: Sacral agenesis or caudal regression syndrome
- **Renal**
  - Renal agenesis
  - Duplication of ureter
  - Renal vein thrombosis
- **GI**
  - Duodenal atresia
  - Lazy (small) left colon syndrome
- **Long Term Problems**
  - **B - B**lindness
  - **O - O**besity
  - **N - N**on ketotic hypoglycemia
  - **D - D**iabetes mellitus

How to remember

- BOND

CLINICAL QUESTIONS

Q. A baby was delivered at 37 weeks of gestation through C-section. Baby's cry was shrill and was non vigorous. Neonatal resuscitation was carried out and was brought to normal, after 8 hours of life the baby had seizures and his blood glucose levels were reported to be 38mg/dl. What out of the following is not a risk factor for the for this type of seizure?

A. Birth asphyxia
B. Small for date baby
C. Maternal diabetes
D. Post term infant

Ans: D

Solution

Neonatal hypoglycemia:

- Blood glucose <40 mg/dl OR
- Plasma glucose <45 mg/dl

Common causes of Hypoglycemia in newborns:

- Prematurity/ SGA
- Respiratory distress syndrome
- Large for date babies (hyperinsulinemia)
- Infant of diabetic Mother
- Infant with erythroblastosis fetalis
- Perinatal asphyxia

Reference: Ghai 9/e p 175

Q. A term neonate with a birth weight of 3980 grams showed the following feature. All of the following can be expected in this baby EXCEPT?

A. Increased risk of congenital heart diseases
B. Polycythemia
C. Hypercalcemia
D. Hypoglycemia

Ans: C

Solution

Hairy pinna (excess hair on ear pinna) points to the diagnosis of infant of diabetic mother.

Problems in infant of diabetic mother:

- Macrosomia- Difficult/ prolonged labour, ↑ chances of birth trauma
- Metabolic- Hypoglycemia, hypocalcemia, hypomagnesemia, polycythemia, hyperbilirubinemia
- Congenital heart defects- VSD, TGA
- CNS- neural tube defects, caudal regression syndrome

Reference: Ghai 9th ed pg 176

19 PERINATAL ASPHYXIA [BIRTH ASPHYXIA]

00:00:40

Definition: Inability to initiate or sustain breathing

Pathophysiology

Hypoxia
Hypercapnia
Acidosis
↓
Multiorgan dysfunction especially CNS (HIE hypoxic ischemic encephalopathy)

Part of brain mc involved in HIE in

- Term neonates → Para sagittal area → Spastic Quadriplegia
- Pre term neonates → Periventricular area → Periventricular Leukomalacia (PVL) → Spastic diplegia

Diagnostic Criteria for Severe Birth Asphyxia 00:05:19

All of the following are required

- Apgar Score: 0-3 for > 5 minutes
- Severe acidosis (cord blood pH < 7.0)
- Presence of any clinical evidence of CNS dysfunction
  - E.g.: Tone abnormalities, seizures, changes in sensorium etc.
- Presence of any evidence of dysfunction of at least 1 organ other than CNS
  - Example
    - → Renal: Acute Tubular necrosis, renal vein thrombosis
    - → Heart: myocardial dysfunction, CCF, arrythmias
    - → Pulm: pulmonary hypertension
    - → GIT: NEC
    - → Hemat: coagulation abnormalities
    - → Metabolic: hypoglycemia, acidosis
    - → Subcutaneous fat necrosis

Staging of HIE 00:09:42

- Sarnat and Sarnat
- Levene's staging
- Thompson score
  - Maximum score = 22
  - Score of ≥ 15 is suggestive of poor outcome

Refer Table 19.1

Treatment of HIE 00:16:48

1. **Supportive Care**
   - NICU admission
   - IVF
   - Maintain euglycemia & normothermia
   - Monitor the baby

Tool used for bedside monitoring of neonates with HIE → aEEG (Amplitude Integrated Electroencephalography)

2. **Latest Rx Modality for neonates with Moderate To Severe HIE**
   - **Therapeutic Hypothermia**
     - Temp. maintained is 33.5° c – 34.5° c
     - Preferred in babies > 35 weeks gestation
     - Used in 1st 4-6 hours of life
     - Decreases mortality and neuromorbidity
     - Due to some side effects, done at tertiary care centre.

3. **Neonatal Seizures treatment**
   - DOC: phenobarbitone
   - 2nd line: levetiracetam
   - Mc type: subtle seizures
   - Mc cause: hypoxia
   - Type with best prognosis: Focal clonic seizures
   - Types with worst outcome: myoclonic seizures
   - Preferred initial CNS imaging: Transcranial ultrasound (cranio sonogram)

Table 19.1

Parameters	Stage 1 (mild HIE)	Stage 2 (Moderate HIE)	Stage 3 (severe HIE)
1. Level of consciousness	Hyper alert/irritable	Normal/ depressed (lethargic)	Comatosed
2. Tone	Normal	Mild hypotonia	Severe hypotonia
3. Moro's reflex	Exaggerated	Normal/ depressed	Absent
4. Seizures	Not seen	Present	Not seen
5. Autonomic involvement	• Generalized sympathetic overactivity - mydriasis • ↑ Heart rate	• Generalized parasympathetic overactivity • Miosis • Bradycardia	• Both systems are depressed • Pupils mid dilated • Variable HR
6. prognosis	99% normal outcome	80% Normal outcome	• 50% die • 50% severe neurological sequelae

CLINICAL QUESTIONS

Q. An infant born to a primigravida of 28 yrs of age, gestational age 36.4 weeks, and birth weight of the baby is 1500 grams. The cry was delayed and weak. On examination reflexes were sluggish and on U/S brain: no solid or cystic lesion seen mild hydrocephalus with dilated all 4 ventricles brain edema grade 2 parenchymal and IVH including germinal matrix. Grade 2 intracranial hemorrhage was ruled out. CT SCAN brain: Extensive white matter edema involving the subcortical regions of frontal, parietal, and temporal lobes causing effacement of the right lateral ventricle. No hemorrhagic density was identified. Hypoxic Ischemic encephalopathy involving frontal, parietal, and temporal regions. Which part of the brain is most commonly involved?

A. Periventricular area
B. Parasagittal area
C. Basal ganglia
D. Hippocampus

Ans: B

Solution

- Part of brain most commonly involved in term neonates with HIE: **Parasagittal area**.
- In preterm neonates- Periventricular area.
- The most common cause of seizure in newborn is **Hypoxic ischemic encephalopathy**
- Most common type of neonatal seizures: Subtle seizures

Reference: Ghai 9th ed pg 163

Q. A 32 week baby was born to a mother with eclampsia who was given IV magnesium sulphate. As the delivery was prolonged and the umblical cord was wrapped around the baby's neck led to perinatal asphyxia, his APGAR score was calculated and shifted to the NICU. What is NOT an essential criteria for defining the perinatal asphyxia?

A. Persistence of APGAR score of 5-7 for >5 minutes
B. Prolonged umbilical arterial blood pH <7.0
C. Presence of neurological manifestations in the immediate neonatal period
D. Evidence of multiorgan dysfunction in the immediate neonatal period

Ans: A

Solution

Essential criteria for defining perinatal asphyxia include:

- APGAR score of 0-3 persisting for >5 minutes
- Prolonged acidemia (pH <7.0) on an umbilical arterial blood sample
- Neurological manifestations, e.g. seizures, coma, hypotonia or HIE in the immediate neonatal period
- Evidence of multi-organ dysfunction in the immediate neonatal period

Reference: Ghai 9th ed pg 163

20 IMPORTANT SCORES IN NEONATE

APGAR SCORE

00:00:16

Components	0	1	2
Appearance	Completely blue or pale	Body is pink, extremities are blue	Completely pink
Pulse rate	Absent	< 100 /min	>100 / min
Grimace*	No response	Grimaces only	Coughs/ sneezes
Activity	Limp/ flaccid	Some flexion	Actively moving baby
Respiratory effort	None	Slow & irregular	Normal/ strong

- **Grimace:** Response to stimulation of oropharynx by a catheter/feeding tube
- **APGAR score**
  - Maximum score: 10
  - Minimum score: 0
  - > 7 score: Normal
  - 0 – 3 score: Severe birth asphyxia[9]
  - APGAR score is usually documented at 1 minute and 5 minutes of life
  - Has no role in neonatal resuscitation
  - It has prognostic importance

Previous Year's Questions

Q. APGAR score 3 at 1 minute indicates?
(NEET Jan 2019)

A. Mildly depressed
B. Further resuscitation not needed
C. Severely depressed
D. Normal

SCORES USED TO ASSESS RESPIRATORY DISTRESS

- Preterm neonate: Silverman score
- Term neonate: Downe's score

Silverman Score

00:10:22

Components	0	1	2
Upper chest retractions	Chest & abdomen rise together	Chest wall lags behind abdomen	Chest wall & abdomen move in opposite direction (see saw)
Lower chest retractions	Absent	Minimal	Marked
Xiphisternal retractions	Absent	Minimal	Marked
Nasal flare	Absent	Minimal	Marked
Grunt	None	Audible only with stethoscope	Audible without stethoscope

- Maximum score: 10 & minimum score 0
- 0-3 score: Normal
- > 7 score: Severe Respiratory Distress

Downe's Score

00:18:44

Components	0	1	2
C - Cyanosis	Absent	Present in room air	Present at $FiO_2 \geq 40\%$
A- Air entry	Normal	Decreased	Barely Audible
R- Respiratory rate	< 60 / min	60 – 80 / min	> 80 / min
G - Grunt	Absent	Audible only with stethoscope	Audible without a stethoscope
R- Retractions	None	Mild	Severe

How to remember

- CAR GR

- Min Score: 0
- Max Score: 10
- > 7: Severe Respiratory distress

CRIB SCORE

Clinical Risk Index for Babies 00:22:21

- Score used to predict mortality of neonates in ICU
- Compares performance of different NICU.

SNAP SCORE

Score for Neonatal Acute Physiology

- Uses 34 parameters (vital signs and investigation findings)
- Predicts morbidity and mortality for neonates

Previous Year's Questions

Q. Which of the following scoring is done to assess respiratory distress in neonates?
(JIPMER May 2019)

A. CRIB score
B. Silverman-Anderson score
C. APGAR score
D. SNAP score

21 RESPIRATORY DISORDERS IN NEONATES

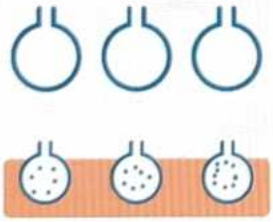
RESPIRATORY DISTRESS SYNDROME/ HYALINE MEMBRANE DISEASE (HMD) 00:00:22

- Mc cause of respiratory distress in a preterm neonate
- **Basic Defect:** Deficiency of mature surfactant
- **Surfactant:** Composition is
  - DPPC [Dipalmitoyl phosphatidylcholine] or lecithin [most imp. component]
  - Phosphatidyl glycerol
  - Cholesterol
  - Surfactant proteins A, B, C, D
    → B: most important surfactant protein
- **Synthesis**
  - Begins in fetal lungs: 20 weeks gestation
  - Begins to appear in amniotic fluid: 28-32 weeks of gestation
  - Mature surfactant in adequate amount: > 35 weeks of gestation
- **Function**
  - To decrease surface tension of alveoli i.e. it prevents alveoli from collapsing during expiration

Pathophysiology of Respiratory Distress Syndrome 00:08:25

- Deficiency of mature surfactant
  - Alveolar collapse
  - Diffuse alveolar damage
  - Interstitial edema
  - Fibrin deposition

  } Eosinophilic Hyaline Membrane appearance on Lung Biopsy



Clinical features

- A preterm neonate born at < 35 weeks of gestation presenting with respiratory distress soon after the birth with typical CXR findings

CXR findings in RDS 00:13:03

- Ground glass haziness of lungs
- Presence of air bronchogram
- Reticulogranular or reticulonodular appearance
- Features of lung collapse

Diagnosis 00:16:33

- Clinical features
- CXR findings
- Ways to detect adequacy of surfactant in amniotic fluid:
  - L:S Ratio (Lecithin: sphingomyelin ratio) > 2:1→ mature surfactant
  - Shake test

Shake Test

  - Phosphatidyl glycerol estimation
  - Nile blue sulphatase test- to detect lung maturity

Treatment of RDS 00:21:28

- Supportive care
- Mild RDS: CPAP (continuous positive airway pressure)
- Moderate to severe RDS
  - Intratracheal Surfactant +Respiratory support [CPAP/ mechanical ventilation + O_2]

Prevention of RDS 00:24:52

Antenatal Corticosteroids

- Indication
  - To all pregnant ladies who are expected to deliver between 24 -34 weeks of gestation.
- Steroid of Choice
  - Inj. Betamethasone: 12 mg I.M, 2 doses, 24 hrs apart [12 x 2 = 24] (or)
  - Inj. Dexamethasone: 6 mg I.M, 4 doses, 12 hrs apart [6 x 4=24]
  - Inj. Betamethasone has slightly more neuroprotective effect: Steroid of choice

- Recommended by Indian government → Inj. Dexamethasone: Cheaper & easily available, equally efficacious
- Beneficial Effects
  - Decrease RDS
  - Decrease IVH
  - Decrease NEC
  - Decrease neonatal mortality
- Does not decrease the risk of neonatal jaundice

Previous Year's Questions

Q. In a preterm baby with respiratory distress syndrome, which type of cell is deficient? (NEET JAN 2020)

A. Type I alveolar cell
B. Type 2 alveolar cell
C. Alveolar capillary endothelial cells
D. Bronchial mucosal epithelial cells

Previous Year's Questions

Q. When can one diagnose acute respiratory distress in a child? (NEET JAN 2018)

A. Within 7 days of known insult
B. Respiratory failure not fully explained
C. No left ventricular dysfunction
D. All of the above

NEONATAL PULMONARY ALVEOLAR PROTEINOSIS

00:34:54

- Basic Defect: d/t deficiency of Surfactant Protein B Which forms a thin layer of surfactant in the inner layer of alveoli

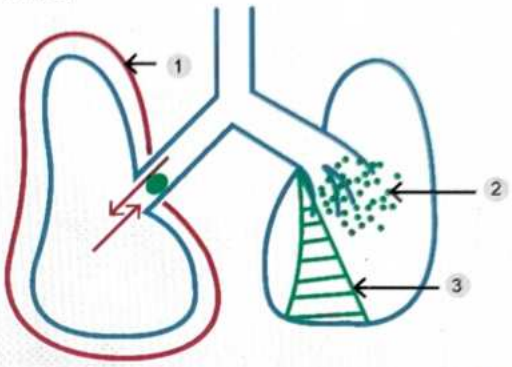
Clinical Features

- A term neonate presenting with severe respiratory distress soon after birth with Chest X-Ray showing ground glass haziness
- No improvement with surfactant therapy
- H/O similar illness in a previous sibling who died (Family History positive)

MECONIUM ASPIRATION SYNDROME (MAS)

00:40:56

- **Meconium:** 1st stool passed by a neonate; greenish black in colour; sterile; comprises of
  - Amniotic fluid
  - Bile (bile pigments and salts)
  - Mucus
  - Lanugo
  - Denuded interstitial epithelial cells
  - Water



Pathophysiology 00:43:42

1. Obstructive emphysema [m/c & most important]
2. Chemical pneumonitis
3. Segmental collapse or atelectasis

Clinical Features 00:48:07

- A term SGA/ IUGR baby, born through meconium stained liquor, presents with respiratory distress soon after birth
- **On examination**
  - AP diameter of chest increased
  - Typical CXR findings

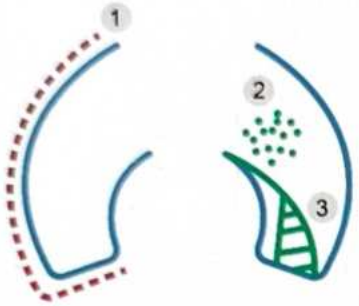
Chest X-Ray in MAS 00:50:15

- Hyper inflated lungs
  - Increased radiolucency of lungs
  - Flattening of domes of diaphragm

- Pulmonary infiltrates
- Segmental collapse

Treatment 00:53:42

- Mainly supportive including respiratory support (O_2 ± mechanical ventilation)
- In severe cases of MAS
  - Intra tracheal surfactant
  - iNO (inhaled Nitric oxide)
  - High frequency ventilation
  - ECMO [Extra Corporeal Membrane Oxygenation]



Complications

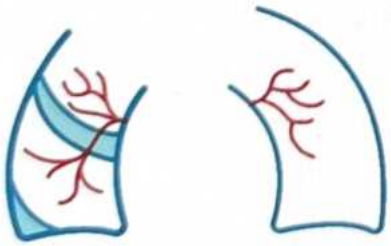
- Pneumothorax
- PPHN [Persistent pulmonary HTN of New Born]

TTNB [TRANSIENT TACHYPNEA OF NEW BORN] 00:58:08

- MCC of respiratory distress in a term neonate
- **Basic Defect:** Delayed clearance of lung fluids
- TTNB is also called "delayed adaptation"
- **Risk Factor:** Delivery by caesarean section

Clinical Features 01:01:58

- Term/ post term neonates
- Born by caesarean section
- Presents with mild respiratory distress, soon after birth that improves Spontaneously in 72 hours with or without typical CXR findings

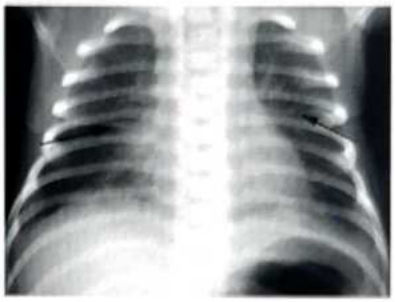


CXR Findings 01:04:04

- Fluid in interlobar fissure
- Pleural effusion
- Perihilar streaking [prominent Broncho vascular markings]

Treatment 01:06:10

- Mild & self-limiting illness
- Usually no Rx required
- Distress usually resolves
- Spontaneously in 48-72 hours



NEONATAL APNEA 01:07:59

- **Definition:** Cessation of breathing for at least 20 sec or for any duration, in the presence of either bradycardia or cyanosis, in a neonate.

Important Causes 01:10:40

1) Neonatal sepsis
2) Neonatal hypothermia
3) Neonatal hypocalcemia
4) Neonatal hypoglycemia
5) Polycythemia
6) Neonatal jaundice
7) NEC
8) Apnea of prematurity
   - More preterm the neonate: more chances of apnea of prematurity
   - It is a diagnosis of exclusion

Treatment 01:14:19

- Respiratory support (CPAP or mechanical ventilation)
- Look for the cause & treat it
  - IV antibiotics for neonatal sepsis
  - Warm up for N. hypothermia
  - IV Ca gluconate for N. hypocalcemia
  - IV 10% dextrose for N. hypoglycemia
  - Partial exchange transfusion with normal saline (Treatment of choice) for polycythemia
  - Inj. Caffeine citrate (DOC) : for apnea of prematurity
  - Inj. Aminophylline: is alternate for apnea of prematurity

NEONATAL HYPOCALCEMIA

	Total Ca	Ionised Ca
In a term neonate	< 8 mg/dl	< 1.2 mmol/L
In a preterm neonate	< 7 mg/dl	< 1 mmol/L

- **Polycythemia:** Hb >22 g/dl or Hematocrit > 65% in neonate, (blood is viscous)

BRONCHOPULMONARY DYSPLASIA/ CHRONIC LUNG DISEASE [CLD]

01:21:24

- Most commonly affects babies born at < 28 weeks of gestation or with birth weight < 1000 gms
- Due to atelectotrauma, volutrauma, free radicals : Injury of lungs

Definition

- BPD is defined for babies born at < 32 weeks gestation, who require O_2 for 1st 28 days of their life.
- Assessed at 36 weeks of PMA [post menstrual age]
- Mild BPD: No supplemental oxygen required
- Moderate BPD: Oxygen required < 30%
- Severe BPD: oxygen required > 30%/ CPAP / Mechanical ventilation

CONGENITAL DIAPHRAGMATIC HERNIA

01:25:47

- A diaphragmatic defect through which abdominal contents may herniate into thorax
  +
- Pulmonary hypoplasia
- Intestinal malrotation

Associated with

- Esophageal atresia
- Congenital heart diseases
- Omphalocele,
- Trisomy 13, 18

Mc type

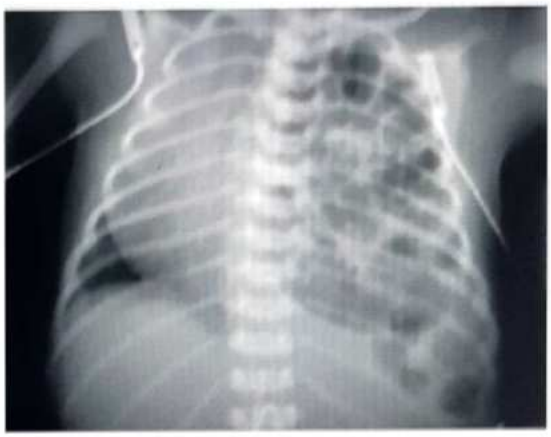
- Postero lateral or Bochdalek variety
- Mc on left side; Mc in females

Clinical Features

- At Birth, usually presents with a TRIAD
  - Respiratory distress
  - Scaphoid abdomen (abdominal contents go into thorax)
  - Mediastinal shift
- Later in life: Intestinal obstruction (due to associated malrotation)

Diagnosis 01:31:08

- Clinical features
- Antenatal USG [between 16-24 weeks]
- Chest X-Ray
  - Bowel gas shadows in thorax
  - Mediastinal shift
  - Pulmonary hypoplasia



Congenital diaphragmatic hernia

Treatment 01:33:16

- Medical management

Refer Flow Chart 21.1

Important Information

- **Bag and Mask ventilation is absolutely contra – indicated in CDH**

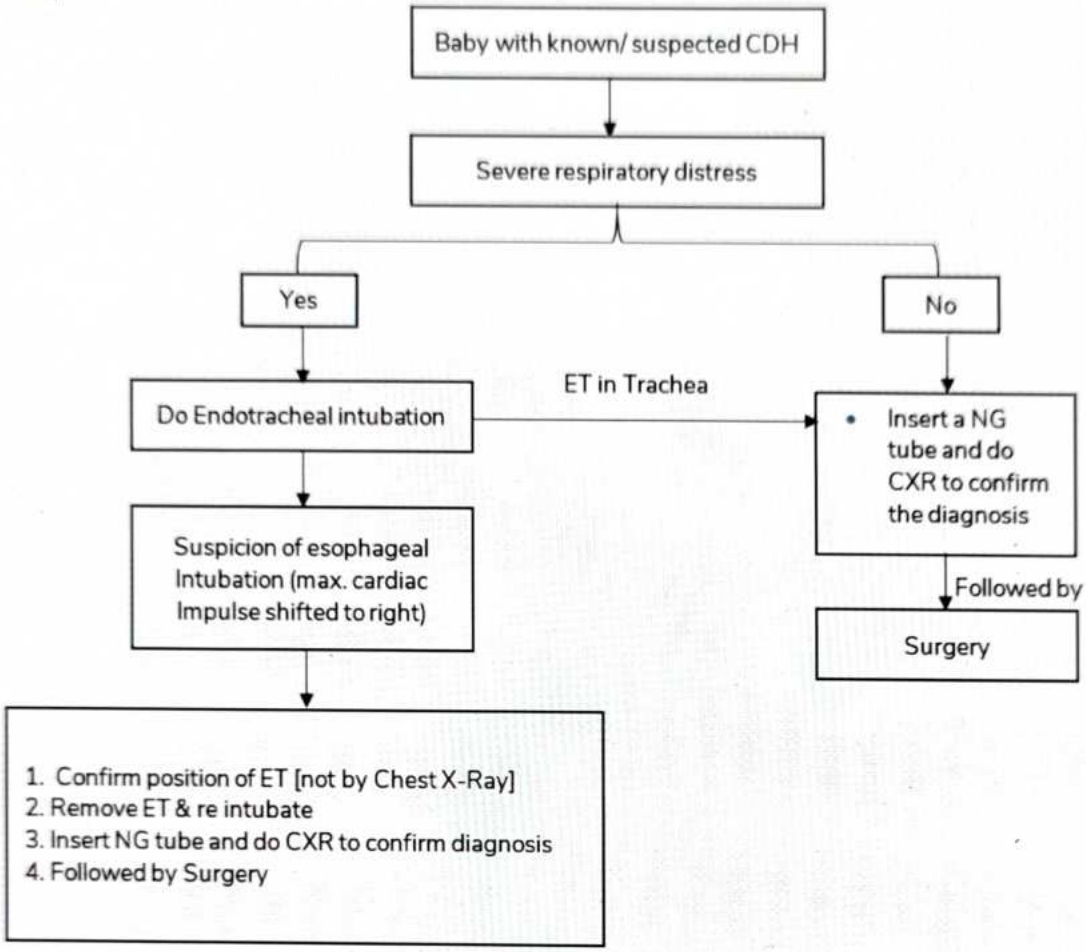
Predictors of Poor Outcome in Congenital Diaphragmatic Hernia 01:43:02

- Severe pulmonary hypoplasia
- Lung head ratio (LHR) < 1
- Any major malformation associated
- Symptoms in 1st 24 hrs
- Liver herniation into thorax
- Need of ECMO

Important Information

- **Mc Cause of mortality in CDH → pulmonary complications/ hypoplasia**

Flow Chart 21.1



CLINICAL QUESTIONS

Q. A preterm neonate was delivered by a primigravida with birth weight of 1600 grams and. 3 weeks Prior to delivery amniocentesis was done in order to know the status of lecithin/sphingomyelin ratio. What does the L/S ratio determines?

A. Lung maturity
B. Fetal circulation
C. Brain
D. Gonad

Ans: A

Solution

The Lecithin-Sphingomyelin (L/S) Ratio:

- Used for assessment of fetal lung maturity prenatally by testing amniotic fluid obtained by amniocentesis.
- Lecithin is produced in the lungs by type II alveolar cells and eventually reaches the amniotic fluid via the effluent from the trachea.
- It is performed by thin-layer chromatography.
- By 35 wk, the lecithin : sphingomyelin (L:S) ratio averages about 2:1, indicative of lung maturity.
- Hence the risk of RDS is very low if the L/S ratio is >2.

Reference: Nelson 20/e pg-816

Q. A G3 P2 L2 A0 S0 delivered a baby boy at 28 weeks of gestation with birth weight of 1200 grams and the child has been shifted to NICU for further treatment. As the lungs of the child are not mature by this time, what would be the recommended dose of steroids given to the child for attaining lung maturity?

A. Inj Betamethasone 12 mg for 2 doses 12 hours apart
B. Inj Betamethasone 12 mg for 2 doses 24 hours apart
C. Inj Dexamethasone 6 mg for 4 doses 24 hours apart
D. Inj Dexamethasone 12 mg for 2 doses 12 hours apart

Ans: B

Solution

- Dose of Inj Betamethasone is 12 mg IM 2 doses, 24 hrs apart OR
- Dose of Inj Dexamethasone- 6 mg IM 4 doses 12 hours apart
- Antenatal steroids should be given to all mother at risk of preterm delivery between 24 & 34 weeks of gestation.

Benefits of antenatal steroids:

- ↓ RDS
- ↓ NEC
- ↓ intraventricular hemorrhage
- ↓ neonatal mortality

Reference: Ghai 9/e p 166

22 NECROTISING ENTEROCOLITIS

00:00:20

- Acute intestinal necrosis of unknown etiology
- **Risk Factors**
  1. Pre maturity [single greatest risk factor → mean gestational age 30-32 weeks; 10% cases occur in term neonates]
  2. Aggressive use of formula feeding
  3. Lack of breastfeeding
  4. Fetal hypoxia
  5. Maternal cocaine abuse
  6. Absent or reversed end diastolic flow in the umbilical artery on antenatal USG
- Part of intestine mc involved: Terminal ileum & ascending colon

MODIFIED BELL'S STAGING OF NEC

00:06:07

Stage I [NEC Suspect]

General Features

- Temperature disturbances
- Apnea
- Lethargy

Abdominal Features

- Feed intolerance

Investigations

- Abdominal X ray
  - Normal (or)
  - Mild intestinal dilation
- Stool examination
  - **Ia**: Occult blood in stool
  - **Ib**: Fresh blood in stool

Treatment

- NPO
- IV fluids
- IV antibiotics

} for 48-72 hrs & reassess

Stage II [Definite NEC]

General Features

- Same as above

Abdominal Features

- Absent bowel sounds
- Mild abdominal distention

Investigations

- Abdominal X ray
  - IIa: Pneumatosis intestinalis [air in the wall of intestine]
  - II b: Portal vein gas
- Treatment
  - NPO
  - IVF + TPN
  - IV antibiotic

} for 7-10 days & reassess

Stage III [Advanced NEC]

General Features

- Shock
- Bleeding
- Life threatening apnea

Abdominal Features

- Abdomen hugely distended & tender
- Abdominal wall cellulitis

Investigations

- Abdominal x ray
  - **IIIa:** Peritonitis
  - **III b:** pneumoperitoneum
- Blood examination
  - Severe acidosis
  - Hyponatremia
  - Refractory thrombocytopenia
- **Prognosis:** 10-30% risk of mortality despite best supportive care

Treatment

- Same as stage II

  +
- IV fluid boluses
- Inotropes
- Blood products
- Mechanical ventilation

  +
- Surgery in III b

Previous Year's Questions

Q. Which among the following is not included in Triad of Necrotizing enterocolitis? (NEET Jan 2019)

A. Thrombocytopenia
B. Metabolic acidosis
C. Hyponatremia
D. Hypokalemia

CLINICAL QUESTIONS

Q. In modified Bell's staging of necrotizing enterocolitis, which of the following stage indicates air in the wall of intestine?

A. Stage IA
B. Stage IIA
C. Stage IIIA
D. Stage IV

Ans: B

Solution

- Necrotizing enterocolitis - Acute intestinal necrosis of Unknown Etiology
- Most common part of intestine involved in necrotizing enterocolitis is terminal ileum and ascending colon
- Modified Bell's staging of NEC:
  - Stage Ia – Occult blood in stool
  - Stage Ib – Fresh Blood in stool
  - Stage IIa – Pneumatosis intestinalis (Air in the wall of intestine)
  - Stage IIb – Portal vein gas
  - Stage IIIa – Peritonitis
  - Stage IIIb– Pneumoperitoneum

Reference: Nelson paediatrics 2018 edition page no: 685

Q. Based on modified Bell's staging of Necrotizing enterocolitis, Which stage requires surgery as its management?

A. Stage Ib
B. Stage IIb
C. Stage IIIb
D. iStage IVb

Ans: C

Solution

- Necrotizing enterocolitis - Acute intestinal necrosis of Unknown Etiology
- Most common part of intestine involved in necrotizing enterocolitis is terminal ileum and ascending colon
- Modified Bell's staging of NEC:
  - Stage Ia – Occult blood in stool
  - Stage Ib – Fresh Blood in stool
  - Stage IIa – Pneumatosis intestinalis (Air in the wall of intestine)
  - Stage IIb – Portal vein gas
  - Stage IIIa – Peritonitis

- Stage IIIb– Pneumoperitoneum
- Stage I – NEC suspect
  - Treated with NPO, IV fluids and IV antibiotics – reassess after 48 – 72 hours
- Stage II – Definite NEC
  - Treated with NPO, IV fluids + Total parenteral nutrition and IV antibiotics - Reassess after 7 -10 days
- Stage III – Advance NEC
  - Stage IIIa - Same as stage II
  - Stage IIIb – surgery

Reference: Nelson pediatrics 2018 edition page no: 685

23 NEONATAL JAUNDICE

- 60 % of term neonates & 80% of preterm neonates have clinical jaundice in 1st week of life
- Clinical jaundice in neonates is seen at bilirubin level > 4-6 mg/dl
- M/c/c of readmission of a neonate discharged from a hospital: Neonatal jaundice
- M/c/c of neonatal morbidity in 1st week: N. jaundice

Physiological jaundice v/s pathological jaundice

Physiological Jaundice	Pathological Jaundice
• Icterus / clinical jaundice never appear in 1st 24 hours of life • Always unconjugated; urine does not stain diapers & no pale stools • Palms & soles never stained yellow. • Clinical jaundice does not persist beyond 2 weeks in term neonates & 3 weeks in preterm neonates	• Clinical jaundice may appear in 1st 24 hours of life • May be conjugated/ nconjugated High colored urine ± pale stools may be seen • Palms & soles may be stained yellow • May persist beyond 3 weeks

Why does Physiological Jaundice of newborn occur?

00:08:00

- Higher production of bilirubin
  - Higher Hb level in neonates
  - Shorter life span of RBCs (90 days vs 120 days)
  - More ineffective erythropoiesis
- Ineffective carrier mediated uptake of bilirubin by liver
- Immature UDP Glucoronyl transferase enzyme activity
- ↑ sed enterohepatic circulation in neonates

Breastfeeding jaundice v/s breast milk jaundice

00:11:38

Breast feeding Jaundice	Breast Milk Jaundice
• d/t inadequate breastfeeding ↓ Dehydration ↓ Relative polycythemia ↓ Higher bilirubin level	• d/t substances present in breast milk like pregnanediol & free fatty acids, that interfere with the conjugation of bilirubin
• Rx: Frequent breastfeeding	• Rx: Continue breastfeeding. Breast feeding may be temporarily withheld if bilirubin >20mg/dl.

Important Causes Of pathological jaundice

A. Unconjugated hyperbilirubinemia 00:15:29

↑ Production of Bilirubin	↓ Conjugation of Bilirubin
• Hemolytic disorders o Erythroblastosis fetalis [Hemolytic disease of newborn] → MC cause of neonatal jaundice in 1st 24 hrs of life o Hereditary spherocytosis o G6PD deficiency	• Crigler Najjar syndrome o Deficiency of UDP glucuronyl transferase enzyme o Type I: Complete deficiency o Type II: Partial deficiency (Rx: phenobarbitone - enzyme inducer)
• Polycythemia	• Gilbert syndrome
• Delayed cord clamping	• Down syndrome
• Cephalhematoma	• Congenital hypothyroidism
• Infant of diabetic mother	

B. Conjugated Hyperbilirubinemia

00:20:51

Conjugated Bilirubin > 2 mg/dl (or) 20% of total bilirubin

Non-Obstructive Causes

- Infections
  - Viral: EBV, CMV, hepatitis
  - Bacterial: Congenital TB [Ghon focus seen in liver]
  - Parasitic: Toxoplasmosis
- Toxins
  - Sepsis, UTI, TPN
- Metabolic
  - Tyrosinemia
  - Galactosemia
  - Hereditary fructose intolerance
  - Alpha 1 antitrypsin deficiency
  - Cystic fibrosis
- Idiopathic neonatal hepatitis
  - MC cause of conjugated hyperbilirubinemia in neonates

Obstructive Causes

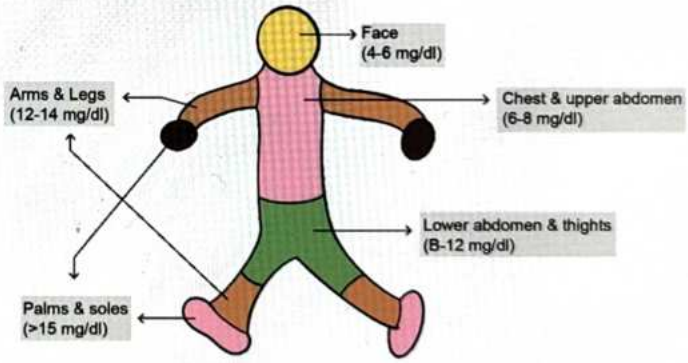
Intra Hepatic Causes	Extra Hepatic Causes
• Congenital hepatic fibrosis	• Extra hepatic biliary atresia (EHBA)
• Caroli's disease	• Choledochal cyst
• Progressive familial intra hepatic cholestasis [PFIC]	• Stones
• Alagille syndrome (bile duct paucity syndrome) o Triangular facies o Butterfly vertebrae o Pulmonary stenosis	• Stricture
• Dubin Johnson syndrome o Pigmented liver [Dark liver]	• Mass
• Rotor syndrome	

Important Information

- Screening test for EHBA: HIDA Scan (or) hepatic scintigraphy
- Surgery for EHBA
  - KASAI Procedure [portoenterostomy]: favourable results if done < 8weeks of life
- EHBA is the MC indication for liver transplantation in children

Clinical Features of Neonatal Jaundice

- Icterus in neonates has a cephalocaudal progression
- Ways to detect neonatal jaundice
  - Clinical examination: modified Krammer's rule
  - Transcutaneous bilirubinometer
    - → Advantages: avoids blood sampling
    - → Disadvantage: not very reliable in
      a. 1st 24 hours of life
      b. gestational age <35 weeks
      c. baby on phototherapy
      d. bilirubin >12-14mg/dl
  - Serum bilirubin level



MODIFIED KARMMER'S RULE (approximate estimation)

	Lemon yellow (mg/dl)	Lemon yellow (mg/dl)
Face	5 – 7	7 – 9
Chest and upper abdomen	7 – 9	9 – 11
Lower abdomen and thighs	9 – 11	11 – 14
Arm and legs	11 – 13	14 – 16
Palms and soles	13 – 15	≥ 17

Neurological Manifestations 00:38:44

- Most Commonly involved part of brain in neonatal jaundice: Basal ganglia
- Type of cerebral palsy seen: Extra pyramidal type

Important Information

- Kernicterus • Yellow staining of basal ganglia [previously used term]

Acute Bilirubin Encephalopathy

- **Early features [mild]**: hypotonia, poor feeding, loss of moro's reflex
  ↓
  Fever, irritability, seizures
  ↓
- **Features of Advanced disease (severe)**: Hypertonia Opisthotonic posturing, coma, death

Chronic Bilirubin Encephalopathy

- Sensorineural hearing loss
- Athetosis
- Dental dysplasia dental enamel changes)
- Mental retardation
- Upward gaze limitation

How to remember

- SAD MUM

Treatment of Neonatal Jaundice 00:55:08

I. Phototherapy
II. Exchange transfusion
III. Drugs

Exchange Transfusion

- Used in very severe cases, especially erythroblastosis fetalis
- Double volume exchange transfusion done

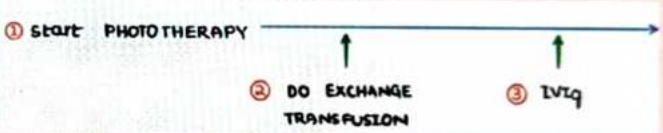
Drugs

- IV Ig (Intravenous immunoglobulin)
  - Used in erythroblastosis fetalis
  - Occupies the receptors for FC segment of Ig in reticuloendothelial system & prevents further production of Ig

  - Phenobarbitone

Important Information

- Severe Neonatal Jaundice Due To Erythroblastosis Fetalis → Treatment Order



Phototherapy

- Most effective wavelength of light used
  - 460-490 nm [Ghai 9th and AIIMS NICU protocol]
  - 420-470 nm [Nelson 20th]
- Mechanisms by Which Phototherapy Acts

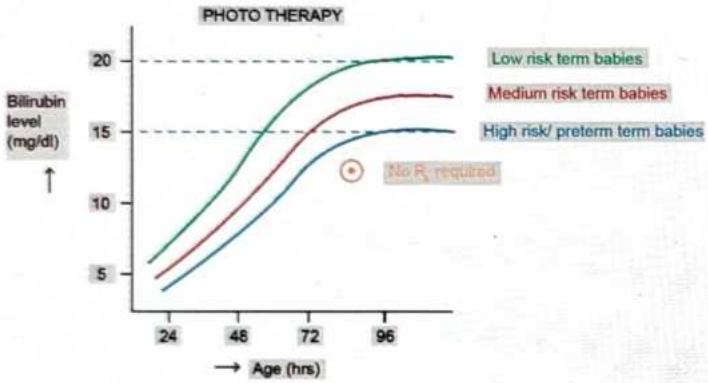
1. Photo Isomerisation
   - Bilirubin → Polar compound → excreted through kidney without conjugation
   - Slow & reversible
2. Structural Isomerisation
   - Bilirubin → Lumirubin → excreted through kidney without conjugation
   - Faster & irreversible
   - Most important mechanism by which phototherapy acts
3. Photo Oxidation [least important]
   - Irradiance should be at least 30 micro W/cm 2/nm
     → Measured using flux meter
   - Effectiveness of Phototherapy Depends Upon
     → Exposed surface area of baby
     → Distance b/w baby & phototherapy unit [30-45 cm]

→ Type of lamp used: LED lamps > CFL Lamps

- Effectiveness does not depend on skin pigmentation of baby

Adverse Effects of Photo Therapy 00:57:00

- Bronze baby syndrome
- Dehydration
- Watery diarrhea
- Hypocalcemia
- Retinal toxicity
- Gonadal toxicity or mutations
- Impaired maternal child bonding



- **In Otherwise Healthy Term Neonates**

Age	Phototherapy cut off	Exchange transfusion cut off
24-48 hrs	> 15 mg/dl	> 20 mg/dl
48-72 hrs	> 18 mg/dl	> 25 mg/dl
> 72 hrs	> 20 mg/dl	> 25 mg/dl

- **In Preterm Neonate**
  - Phototherapy cut off → 1% of birth weight in grams
  - Exchange transfusion cut off → Phototherapy cutoff +5 [mg/dl]

    e.g., birth weight = 1400 gm
    phototherapy cutoff = 1% of 1400
    = 14 mg/dl
    Exchange transfusion cutoff = 14+5
    = 19 mg/dl

- Indications of exchange transfusion in a baby with RH incompatibility
  - Cord blood Bilirubin: > 5 mg/dl
  - Cord blood Hb: < 10 mg/dl

Previous Year's Questions

Q. A term neonate, with a birth weight of 2700 g who is otherwise well, and is exclusively breastfed, presents for routine evaluation. His total serum bilirubin is found to be 14 mg/dl on day 5. What is the management? (NEET Jan 2020)

A. Phototherapy
B. Exchange transfusion
C. Stop breast feeding for 2 days
D. No active treatment required

CLINICAL QUESTIONS

Q. In a clinical class of pediatric, students were asked to look after a baby who was 8 hours old and asked to mention all the signs that are physiologically present in him. Which out of the following sign is not physiological in this baby?

A. Acrocyanosis
B. Soft systolic murmur
C. Icterus
D. Heart rate between 120-140/min

Answer: C

Solution

- Clinical jaundice or icterus detected in a neonate at birth, or within 1st 24 hours of life indicates '**pathological jaundice**', so it is not present normally.
- Acrocyanosis is bluish discoloration of extremities which can be normally seen in neonates.
- Normal heart rate of newborn: 120-140 bpm
- Soft systolic murmur can be normally seen at birth (due to increase in Pulmonary Blood Flow because of fall of PVR at birth)

Physiological jaundice

- **Pathological jaundice**
  - Never appears in 1st 24 hours of life
  - May appear in 1st 24 hours of life
  - Always unconjugated
  - May be conjugated/unconjugated
  - Palms and soles never stained yellow
  - Palms and soles may be stained yellow
  - Does not persist beyond 2 weeks in term neonates and 3 weeks in preterm neonates
  - May persist beyond 3 weeks

Extra edge

Important conditions in neonates that are normal and do not require any specific treatment:

- Milia
- Erythema toxicum neonatorum
- Mongolian spots
- Stork bite
- Epstein Pearl
- Acne neonatorum
- Mastitis neonatorum
- Subconjunctival haemorrhage
- Vaginal bleeding
- Hymenal tags

Reference: Ghai Essential Pediatrics 9th ed pg 130, 168

Q. A 36 weeks newborn, with birth weight of 2000 grams, was kept in the neonatal nursery for routine care. Baby's bilirubin levels were elevated and the child was transferred to NICU for phototherapy. All of the following affect the effectiveness of phototherapy EXCEPT:

A. Skin pigmentation
B. Distance between the baby & phtotherapy unit
C. Spectral irradiance
D. Type of lamp used

Answer: A

Solution

- **The therapeutic effect of phototherapy depends on:**
  - Light energy emitted in the effective range of wavelengths
  - Distance between the lights and the infant
  - Surface area of exposed skin
  - Type of lamp light used- LED lamps are better than fluorescent lamps
  - Spectral irradiance
  - Rate of hemolysis and in vivo metabolism and excretion of bilirubin.
- Dark skin/skin color does not reduce the efficacy of phototherapy.

Reference: Nelson 20th/e page- 877; Ghai Essential Pediatrics 9th ed pg 171

24 ERYTHROBLASTOSIS FETALIS

- Aka 'Hemolytic disease of newborn' (HDN) 00:00:20
- Basic defect- Due to transplacental passage of maternal antibodies against paternally derived RBC antigens, which causes increased RBC destruction in the neonate/ Infant.
- ABO incompatibility is the MC cause of HDN, but it is usually a much milder illness, as compared to Rh incompatibility.

ERYTHROBLASTOSIS FETALIS DUE TO RH INCOMPATIBILITY 00:04:33

- Rh: c, C, D, E, e
- RhD Ag is responsible for 90% cases of Rh incompatibility

Pathophysiology of HDN (Rh incompatibility) 00:06:03

Refer Daigram 24.1

- In ABO incompatibility, due to naturally occurring antibodies (Anti-A or Anti-B) even first pregnancy may be affected.

Next/ subsequent pregnancies (In Rh incompatibility) 00:13:32

- Mother Rh –ve (already sensitised)
- Father Rh +ve
- Fetus is Rh +ve

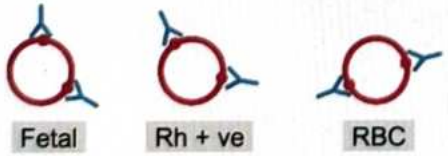
Repeat encounter with fetal RhD Ag

↓

Rapid production of anti Rh IgG Ab by mother

↓

Maternal anti Rh IgG crosses placenta & reaches fetus & binds to fetal RBCs

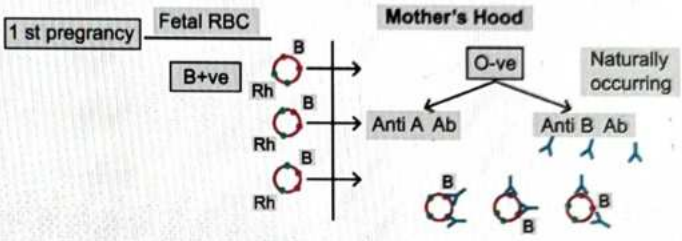


Are destroyed by RE system of fetus

↓

Hemolysis of fetal/ Neonatal RBCs (HDN)

- Severity of Rh incompatibility worsens with subsequent pregnancies due to repeated immune stimulation.
- If the mother & fetus are both ABO & Rh incompatible (Less severe) mother is partially protected against sensitisation by RhD Ag due to rapid removal of fetal RBCs, by mother's pre-existing anti-A or Anti B IgM Ab.



- Injection of anti Rh Ig into Rh –ve mother both-during pregnancy & immediately after delivery of each Rh +ve baby, reduces the risk of HDN due to Rh incompatibility

Clinical features of HDN

- Varying severity based on
  - Immunogenicity of Blood Group Ag
  - Amount of blood transferred
  - Immune response of mother
- Mildest: only lab evidence of hemolysis
- Severe cases

Severe hemolysis		
○ Compensatory hyperplasia of erythropoietic tissue in fetus/ newborn ○ Massive Hepatospleno megaly	If Hemolysis exceeds compensatory capacity of body ↓ Severe Anemia (Hb < 5-7 g/dl in fetus) ↓ ○ Pallor ○ Cardiac decompensation (cardiomegaly, respiratory distress) ○ Circulatory collapse ○ Anasarca (generalised edema) ○ Hypoalbuminemia due to hepatic dysfunction	○ Jaundice usually within 1st 24 hrs of life

Hydrops Fetalis 00:34:15

- Presence of abnormally excessive fluid in 2 or more fetal compartments e.g. skin, pleural, pericardium, peritoneal cavity, placenta, amniotic fluid.
- Immune – mediated Hydrops in Erythroblastosis fetalis.

In severe HDN

- Hypoglycemia: due to hypertrophy of pancreatic islet cells & hyperinsulinemia
- Petechiae/ purpura: due to decreased platelet production & DIC
- CNS damage: due to Kernicterus

INVESTIGATION FINDINGS 00:37:59

- Maternal & Neonatal ABO & Rh blood grouping
- Direct coomb test (usually positive)
- Anemia (Hb & Hct)
- ↑ Reticulocyte count
- PS → Polychromasia with ↑ nRBCs
- ↑ ed unconjugated bilirubin
- ↑ ed LDH

During pregnancy (When mother Rh positive & father Rh positive)

- Fetal Rh status may be detected by
  - CVS
  - Amniocentesis or } Invasive
  - Testing of fetal DNA in maternal circular (non-invasive)
- Severity of fetal anemia may be mentioned by
  - PUBS (Percutaneous Umbilical Blood Sampling) or
  - Doppler ultrasound of middle cerebral artery (MCA) of fetus

HYDROPS FETALIS 00:44:49

- **Definition :** Accumulation of excessive fluid in 2 or more of body compartments e.g. Skin, pleural cavity, pericardium, peritoneal cavity, amniotic fluid

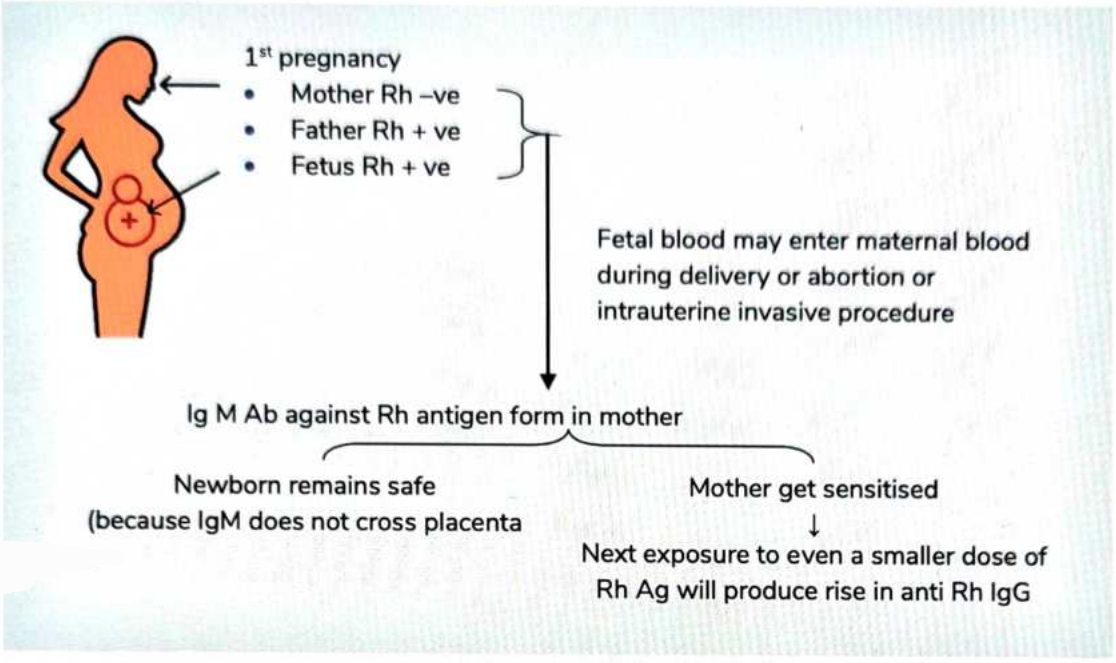
Etiology

- Immune Erythroblastosis fetalis (Rh incompatibility)
- Non-Immune
  - **A - A**nemia: - thalassemia
  - **B - B**one ds: Osteogenesis Imperfecta, skeletal dysplasia's
  - **C - C**NS- Encephalocele, Intracerebral Hemorrhage
  - **C - C**ardiac
    - → Structural: HLHS, Endocardial cushion defect, Cardiomyopathies
    - → Arrhythmias: Cong. Heart block, SVT, A. fibrillation
  - **C - C**hest/Thorax: Diaphragmatic hernia, mediastinal teratomas
  - **C - C**ancer/Tumors: Neuroblastoma, Hepatoblastoma, Sacrococcygeal Teratomas
  - **D - D**iseases of Lymphatic system: Cystic hygroma, lymphangiectasias
  - **E - E**rrors of metabolism: Gaucher's disease, NPD, MPS
  - **F - F**low related: Twin- Twin tx, Thrombosis of umbilical or renal vein
  - **G - G**enetic causes: Trisomy 13, 18, 21, Noonan syndrome.
  - **H - H**epatic causes: congenital Hepatic fibrosis.
  - **I - I**nfections: Toxoplasma, Syphilis, Rubella, CMV, Parvo, Leptospirosis
  - **I - I**nfant of Diabetic mother
  - **K - K**idney: Congenital Nephrosis

How to remember

- A B C D E F G H I K

Daigram 24.1



1st pregnancy
Mother Rh –ve
Father Rh + ve
Fetus Rh + ve
Fetal blood may enter maternal blood during delivery or abortion or intrauterine invasive procedure
Ig M Ab against Rh antigen form in mother
Newborn remains safe (because IgM does not cross placenta
Mother get sensitised
Next exposure to even a smaller dose of Rh Ag will produce rise in anti Rh IgG

CLINICAL QUESTIONS

Q. Which of the following statements are correct regarding Erythroblastosis fetalis?

1. It is also known as hemolytic disease of newborn (HDN)
2. Most common cause of HDN is Rh incompatibility
3. Severity of Rh incompatibility worsens with subsequent pregnancies due to repeated immune stimulation
4. Injection of anti-RhIg into Rh-negativemother both during pregnancy and immediately after delivery reduces the risk of HDN by ABO incompatibility

A. Only 1,2 is correct
B. Only 3,4 is correct
C. Only 1,3 is correct
D. Only 2,4 is correct

Answer: C

Solution

- Erythroblastosis fetalis is also known as hemolytic disease of newborn
- It is due to transplacental passage of maternal antibodies against paternally derived RBC antigens, which causes increased RBC destruction in the neonate/infant
- Most common cause of HDN is ABO INCOMPATIBILITY, but it is usually a milder illness as compared to Rh incompatibility
- Severity of Rh incompatibility worsens with subsequent pregnancies due to repeated immune stimulation
- Injection of anti-Rh Ig into Rh-negativemother both during pregnancy and immediately after delivery reduces the risk of HDN by Rh incompatibility

Reference: Nelson 21st edition page no: 4144

Q. Which of the following statements are correct regarding Erythroblastosis fetalis?

1. Hydrops fetalis – presence of abnormally excessive fluid in 3 or more fetal compartments
2. In severe hemolytic disease of newborn, hyperglycemia is seen
3. Investigation findings reveals polychromasia with increased nucleated RBC's
4. Thalassemia can lead to hydropsfetalis

A. Only 1,2,3 is correct
B. Only 3,4 is correct
C. Only 1,2,4 is correct
D. Only 1,2 is correct

Answer: B

Solution

- Erythroblastosis fetalis is also known as hemolytic disease of newborn (HDN)
- It is due to transplacental passage of maternal antibodies against paternally derived RBC antigens, which causes increased RBC destruction in the neonate/infant
- Hydrops fetalis – presence of abnormally excessive fluid in 2 or more fetal compartments
- In severe HDN –
  - Hypoglycemia – due to hyperinsulinemia caused by hypertrophy of pancreas
  - Petechiae/purpura – due to decreased platelet production
  - CNS damage due to kernicterus
- Immune casue of hydropsfetalis – Erythroblastosisfetalis
- Thalassemia is one of the non-immune causes of hydropsfetalis

Reference: Nelson 21st edition page no: **4144**

25 LATEST UPDATES IN NEONATOLOGY

Antenatal Corticosteroids 00:00:53

- Not recommended in late preterm neonates (34 weeks to $36^{6/7}$ weeks)
- In peri viable gestation (22 to 24 weeks) decision to be individuated based on capability of NICU & parent's wishes.

Golden hour 00:02:24

- 1st hour of life is called the golden hour.
- Interventions should include
  1. Thermal protection
  2. Establishment of FRC of lungs in least invasive manner
  3. Avoiding hyperoxia by titrating O_2 administration

Antenatal $MgSO_4$ for neuroprotection 00:03:58

- Indicated for pregnant women ≤ 31 weeks of gestation with imminent preterm birth
- **Effects**
  - Neuroprotection by
    - → Anti-inflammatory effects
    - → Vasodilation
    - → Decreased free radical injury
    - → Inhibiting ca^{2+} influx into cells

"Coming in of Milk" 00:06:00

- Feeling of breast fullness & milk leakage from nipples, as perceived by mother.
- 59-67 hours after delivery
- Earlier in multiparous
- If it occurs later than 72 hours: called as Delayed onset of lactation

Perinatal Asphyxia 00:07:38

- Most common cause of stillbirth
- Severity can be assessed by
  - Sarnat & Sarnat staging
  - Levine's classification
  - Thompson score
    - → Max (worst) score: 22
    - → Score ≥ 15 is suggestive of Abnormal outcome at 12months of age with PPV of > 92%

PDA in Preterm Neonates 00:09:21

- Both Indomethacin & Ibuprofen are equally efficacious (70-80%) in preterm ≤ 32 weeks
  - Ibuprofen is preferred in view of better safety profile
- Oral PCM has been shown to be equally efficacious as Ibuprofen

Hypotension in 1ST 24 Hours of Life 00:11:19

- Mean BP < 30 mm Hg
- Mean BP < Gestational age in weeks (mm Hg)

Hyperoxia Test 00:12:20

- Helps to determine whether heart disease is a likely cause in an infant with cyanosis
- Give 100% O_2 for 10 min

  ↓

  PaO_2 < 50mm Hg → Highly sensitive of Cyanotic CHD
  PaO_2 50-150mm Hg → needs further evaluation
  PaO_2 > 150 mm Hg or rise in PaO_2 by > 80-120 mm Hg above base line → Cyanotic CHD is unlikely

Critical CHD 00:14:48

- Cardiac lesions requiring surgical or catheter-based interventions during infancy
- 25% of all CHD

Feed Intolerance in Neonates 00:15:35

- Symptoms: Vomiting, Lethargy, apnea
- Signs
  - Abdomen distension / tenderness
  - Increased gastric residual (>2ml/kg)
  - Reduced / absent bowel sounds
  - Bradycardia or cyanosis

NEC 00:17:04

- L-Arginine: a substrate NO may help in prevention of NEC but no definite recommendation as more evidence required

Invasive Candidiasis in Neonates 00:17:48

- Incidence $\alpha \frac{1}{\text{birth weight}}$
- Most common: C Albicans

Intractable Seizures in Neonates are Seen in 00:18:34

- Pyridoxine deficiency
- Molybdenum cofactor deficiency
- Non ketotic hyperglycinemia (NKH)

- Folinic acid responsive seizures

Umbilical Artery Catheterisation (UAC) 00:20:09

- Most common complication of UAC: Blanching of 1 leg
- Treatment of blanching

Rewarm the opposite leg with warm towel

↓

Reflex vasodilation

↓

Colour of opposite limb improves (If doesn't improve in 5 min, then remove UAC)

LEARNING OBJECTIVES

UNIT 6 : NUTRITION AND MALNUTRITION

- Malnutrition
  - Indices of malnutrition
  - Classification of malnutrition
  - SAM
  - POSHAN Abhiyan

- Breast milk and breast feeding
  - Breast feeding initiation
  - Exclusive breast feeding
  - Reflexes in breast feeding
  - Signs of good positioning and attachment while breast feeding
  - Contraindications of breast feeding
  - Advantages of breast feeding

- Micronutrients in health and disease
  - Micronutrients, their classification
  - Fat soluble vitamins
  - Water soluble vitamins
  - Important minerals
  - Deficiency and treatment of diseases due to mineral and vitamin deficiency

26 MALNUTRITION

- **Mal:** Abnormal, **Nutrition**: Intake of food
- Best indicator of Acute Malnutrition: ↓ in weight for height (Wasting)
- Best indicator of Chronic Malnutrition: ↓ in Height for age (Stunting)
- Cardinal determinants of undernutrition
  1. Low birth weight (LBW)
  2. Infections
  3. Less dietary intake (food)

AGE INDEPENDENT ANTHROPOMETRIC INDICES

00:05:30

Refer Table 26.1

Important Information

- Mild arm circumference is age independent parameter in age group of 1-5 year

CLASSIFICATION OF MALNUTRITION

00:10:52

I. IAP Classification: Based on weight for age and edema
- Normal is weight for age >80% of expected
- Grades

I	71-80% of expected
II	61-70% of expected
III	51-60% of expected
IV	≤50% of expected

- Add 'K' to the category if edema is present
- E.g., wt. for age =55%with edema so grade is III K

II. Gomez Classification: Based on weight for age
- Expected weight= 50th percentile of Harvard standard
- It is the oldest classification.
- It has prognostic value for hospitalized children.
- Normal - weight for age >90% of expected
- Grades
  - (Mild): 75-89% of expected
  - (Moderate): 60-74% of expected
  - (Severe):<60% of expected

III. Who Classification: Based on weight for height, height for age & edema

Weight for height	Height for age
• B/w – 2 to -3 Z score or 70-79% of expected called as Wasting	• Between – 2 to -3 Z score or 85-89% of expected called as Stunting
• < -3 Z score or <70% of expected called asSevere Wasting	• <- 3 Z score or < 85% of expected Severe Stunting

- If edema is present, add 'edematous' to the category

IV. Water low classification: based on weight for height, height for age

V. Welcome Trust Classification
- Based on weight for age & edema

Weight for age	Edema	Category
60-80% of expected	Absent	Under nutrition
60-80% of expected	Present	Kwashiorkor
<60% of expected	Absent	Marasmus
<60% of expected	Present	Marasmic Kwashiorkar

KWASHIORKOR V/S MARASMUS

00:24:38

	Kwashiorkor	Marasmus
Edema	Present	Absent
Appetite	Poor	Voracious
CNS involvement	Apathy and lethary	Active child
Hepatomegaly	Seen	Usually not seen
Skin & hair changes	More common	Less common

Previous Year's Questions

Q. Which of the following if normal rules out PEM? (NEET Jan 2020)

A. Skin fold thickness
B. ECF fluid
C. Lean body mass
D. Serum potassium

Severe Malnutrition

- **Skin Changes:** Flaky paint dermatosis (or) crazy permanent dermatosis

- **Hair Changes**
  - Flag sign: alternate bands of hyperpigmented and hypopigmented hair
  - Easy pluckability
  - Sparse hair
- **Flag sign**

SEVERE ACUTE MALNUTRITION (SAM)

00:29:20

Definition: In a child b/w 6 months to 5 yrs age, as presence of any 1 or more of the following

- Weight for height<-3 Z score or <70% of expected or
- Mid arm circumference<11.5 cm or
- Symmetric bipedal edema of nutritional origin

Complications

00:32:02

- **S** - Sugar deficiency (hypoglycemia) – Blood Glucose <54 mg/dl
- **H** - Hypothermia – rectal temperature <35.5 °C
- **I** - Infections
- **EL** - Electrolyte imbalance especially Hypokalemia
- **DE** - Dehydration
- **D** - Deficiency of micronutrients

How to remember

- SHIELDED

Treatment

00:36:52

1. Initial Hospitalization especially with poor appetite or complications
2. Look for Complications & RX

- Hypoglycemia
  - Asymptomatic: 50ml of 10% dextrose orally or by NG tube
  - Symptomatic: 5ml/kg of 10% dextrose iv
- Hypothermia
  - Remove wet clothing

- Cover appropriately
- Heating device can be used

- Infections: Antibiotics (oral/iv)
- Electrolyte imbalance:Supplement K+, Mg+2
- Dehydration
  - oral: Resomal (rehydration solution for malnourished child)
  - iv fluids (if child is in shock)
- Deficiency of micronutrients – supplement multivitamins & minerals, Fe started later

3. Nutritional Rehabilitation

- Start with:

70 – 80 Kcal/ kg/ day & 0.7 g/ kg/ day proteins

↓ Gradually over 1-2 week [to prevent refeeding / nutritional recovery syndrome]

↓

(Upto 150 – 200 kcal/ kg day) (4 – 5/ kg/ day proteins)

• **Initially**	**Kcal (each 100 ml)**	**Protein (each 100 ml)**
○ Initially F-75 diet started:	75	1gm
○ Later F-100 (catch up diet)	100	3gm

RUTF (ready to use therapeutic food)

- Energy dense, semisolid, minerals and vitamins rich food
- Peanut paste, milk solids, sugar, vegetable oils with added minerals and vitamins.
- 100gm of RUTF has 543 kcal of energy and 15 gm protein

Criteria for Discharge from Hospital

- Child should have lost edema & started gaining weight
- All infections & micro nutrient deficiencies should have been taken care of
- Child's appetite should have improved & he should be accepting well orally
- Mother /caregiver should be confident of taking care of child at home

Failure to respond to treatment

- **Primary failure**
  - Failure to regain appetite by D4
  - Failure to start losing edema by D4
  - Presence of edema on D10.
  - Failure to gain atleast 5gm/kg/day by D10.

- **Secondary failure**
  - Failure to gain at least 5gm/kg/day for 3 consecutive days during rehabilitation phase.

Previous Year's Questions

Q. All are diagnostic criteria for 'severe acute malnutrition' (SAM) except?

(JIPMERNov 2018)

A. Weight for age < - 3 Z score
B. Mid upper arm circumference (MUAC) < 115 mm
C. Presence of bipedal edema
D. Presence of visible severe wasting

Previous Year's Questions

Q. Severe acute malnutrition as per WHO criteria?

(NEETJan 2019)

A. Weight for age - 2 SD less than median
B. Weight for height - 2 SD less than median
C. Weight for age - 3 SD less than median
D. Weight for height - 3 SD less than median

Previous Year's Questions

Q. An anganwadi teacher takes weight and height of 4-year-old child and find out that height for age is < - 2 SD. likely cause is?

A. Chronic malnutrition
B. Acute malnutrition
C. Recent infection
D. No malnutrition

POSHAN ABHIYAN

00:53:04

- Prime minister's overarching scheme for holistic nutrition.
- Launched in march 2018.
- Proper nutrition ensured to baby in 1st 1000 days of life.
- Goal
  - Decrease prevalence of stunting and undernutrition by 2% per annum
  - Decrease nutritional anemia by 3% per annum.

Marasmus

Shakir's Tape

Use to measure mid-arm circumference

Flaky paint dermatosis (or) crazy permanent dermatosis

Flag sign

Bitot Spots(VIT A deficiency)

Angular Cheilosis (Riboflavin deficiency)

Q. What is the skin condition? It can be seen due to deficiency of?

- Phrynoderma
- Deficiency of Vitamins A, B, E or essential fatty acids

Table 26.1

Name	Formula	Normal	Malnutrition
Kanawati & Mc Laren's Index	MAC /HC	0.32-0.33	<0.25
Rao & Singh's Index	$\frac{\text{Wt (Kg)}}{\text{Ht (cm)}^2} \times 100$	>0.14	<0.14
Dugdale's Index	$\frac{\text{Wt (Kg)}}{\text{Ht (cm)}^{1.6}} \times 100$	0.88-0.97	<0.79
Quacker's Midarm Circumference Measuring Stick (Quac stick)	MAC for a given height	>85% of expected	75-85% of expected: malnutrition <75% of expected:severe malnutrition
Jeliff's ratio	HC/CC	For a child > 1 yr age, ratio should be <1	>1 in a child, > 1 yr age

CLINICAL QUESTIONS

Q. A child, 7 years old, is admitted in the hospital as he is suffering from marasmus. His chart for the measurement of weight and mid-arm circumference is maintained on a daily basis in order to keep a check if the child is responding to the treatment or not. Out of all the following devices which device is not used to measure the mid-arm circumference of the child?

A. Bangle test
B. Shakir tape method
C. Quac stick
D. Harpenden calliper

Answer: D

Solution:

- Harpenden caliper is used to measure skinfold thickness which is an indication of subcutaneous fat.
- The other three are used to measure the mid-upper arm circumference.
  - Shakir's tape is used to measure mid-upper arm circumference. It has three coloured zones corresponding to various levels of wasting.
  - In bangle test, a bangle with an internal diameter of 4 cm is passed above the elbow. In severe malnutrition, it can be passed above the elbow, while in normal children it cannot.
  - QUAC stick - Quaker arm circumference measuring stick. It is a measure of expected Mid-arm circumference that would be expected for a given height.

Reference: O. P Ghai textbook of Pediatrics, 8th Ed, page 97

Q. A mothers brings her 8-year-old boy to the primary care provider with complains that the child has become irritable, and looks dull and weak and also that he has lost weight. On examination, edema absent, appetite good, no liver enlargement and hardly any skin/hair changes seen. The socio-economic status of the family was also poor. What is the child probably suffering from?

A. Acute malnutrition
B. Chronic malnutrition
C. Both acute and chronic malnutrition
D. Short stature

Answer: A

Solution:

- Decrease in weight for height (wasting) indicates Acute malnutrition.
- Decrease in height for age (stunting) indicates Chronic malnutrition.
- Short stature - Height below 3rd percentile or < -2SD of expected, according to age and sex of the child.

Waterlow Classification Based on Weight for Height

Nutritional status	Weight for Height (% of Expected)
Normal	>90
Mild wasting	80-90
Moderate wasting	70-79
Severe wasting	<70

Reference: Ghai 9/e p 93

27 BREAST MILK & BREAST FEEDING

Initiation of Breast Feeding 00:00:37

- As soon as possible
  (or)
  Within 1 hour of childbirth (born either by normal vaginal delivery or c-section)

Exclusive Breast Feeding 00:03:20

- Recommended for first 6 months of life exclusively. Child should be fed only breast milk, nothing else, not even sips of water unless medically indicated
- Any form of pre-lacteal feeding is absolutely contraindicated.

What should be initiated at 6 months

- Complementary feeding
- It is defined as semi-solid, energy dense food, given in addition to breast feeding.

Characteristics of food items used for complementory feeding (Pneumonic: AFASS) 00:06:15

- **A** - Acceptable
- **F** - Feasible
- **A** - Affordable
- **S** - Sustainable
- **S** - Safe

When is the breast milk output maximum 00:07:12

- At 5-6 months of lactation
- Approx. 730 ml/day

Factors affecting breast milk output 00:08:00

- Milk output increased by
  - Thought of baby
  - Sight of baby
  - Sound of baby
- Milk output decreased by
  - Pacifiers
  - Bottle feeding
  - Formula / top feeding
  - Lack of night time feeding
  - Incomplete emptying of breasts
  - Cracked /sore nipples
  - Drugs: Dopamine agonists: Bromocriptine, cabergoline

Storage of expressed breast milk (EBM) 00:11:26

- At room temperature (25 degree Celsius): 8-10 hrs
- In a refrigerator (2-8 degree Celsius): 24 hrs
- In a deep freezer (-20 degree Celsius) used in breast milk banks: 3 months

Reflexes Helping in Breast Feeding 00:12:44

- **Baby**
  1) Rooting reflex
  2) Suckling reflex
- **Mother**
  1) Milk secretion reflex (mediated by prolactin)
  2) Milk ejection reflex (mediated by oxytocin)

Signs of Good Positioning While Breast Feeding 00:15:25

1. Body of the baby should be well supported.
2. Entire body of the baby should be turned towards the mother.
3. Occiput, shoulders and buttocks of baby should be in a straight line.
4. Abdomen of baby should touch the abdomen of the mother.

Signs of Good Attachment While Breast Feeding 00:17:15

1. Mouth of the baby should be wide open.
2. Entire areola should be in baby's mouth except a small upper part that may be visible.
3. Lower lip of baby should be everted /turned out.
4. Chin of the baby should touch the mother's breast.

Contraindications to Breast Feeding 00:19:55

- Related to baby
  1) Galactosemia
  2) Lactose intolerance
- Related to mother
  - Absolute contraindications
    → Mother on chemotherapy or radiotherapy
  - Relative contraindications
    → Maternal HIV

→ Maternal active varicella zoster (HHV-3) involving nipple area
→ Maternal active herpes simplex involving nipple area
→ Maternal active untreated tuberculosis
→ Breast abscess

Previous Year's Questions

Q. Breast feeding is contraindicated in (JIPMER Dec 2019)

A. MDR TB
B. Zika virus infection
C. Hep B Infection
D. Mastitis with abscess

Maternal Medications contraindicated during lactation 00:24:26

- Antineoplastic agents
- Cyclosporine (immunomodulator)
- Lithium
- Certain antibiotics: Tetracycline, chloramphenicol
- Drugs decreasing breast milk production
  - A - Amphetamine
  - B - Bromocriptine
  - C - Cocaine

How to remember

- A B C

Important Information

- Pre-lacteal feeding is absolutely contraindicated due to the risk of clostridial sepsis.

Advantages of Breast Feeding for Baby 00:27:50

1. **Composition**: Composition of the breast milk is perfectly suitable for the baby.

i. Carbohydrates

- Breast milk is richer in lactose [7gm/dL] as compared to cow's milk [4.5 gm/dl]
- Breast milk (lactose) gives more energy as carbohydrates to baby.
- Galactose formed from lactose forms galactocerebrosides which are required for the central nervous system development.
- Lactose helps in calcium absorption.
- Lactose helps in development of lactobacilli in the intestine.

ii. Proteins

- Breast Milk contains lesser protein [1gm/dl] as compared to cow's milk [3.5 gm/dl] which poses lesser solute load on kidneys.
- Breast Milk is richer in whey proteins (lactalbumin) which are much more easily digestible as compared to casein in cow's milk.
- Breast Milk contains adequate amount of amino acids like cysteine, taurine, methionine which are required for CNS development of the baby.

Previous Year's Questions

Q. Amount of protein present in 100 ml of breast milk? (JIPMER May 2019)

A. 2.2 gm
B. 1.1 gm
C. 0.55 gm
D. 3.39 gm

iii. Lipids

- Breast Milk is richer in PUFA [poly unsaturated fatty acids] – beneficial for the baby
- Breast Milk contains 30 time more DHA (Docosahexaenoic acid) than cow's milk which is required for CNS development of the baby.

Previous Year's Questions

Q. Fat content of breast milk? (JIPMER Dec 2019)

A. 2.4%
B. 3.4%
C. 4.4%
D. 5.4%

iv. Minerals

- Calcium: phosphate ratio in Breast Milk is such that it favors calcium absorption. [Cow's Milk is richer in phosphate which hinders calcium absorption so increasing the chances of hypocalcemia in the baby]
- Iron: present in Breast Milk is not in much quantity but is much more easily absorbable than the one present in cow's milk.

v. Vitamins

- Breast Milk contains adequate amounts of all vitamins except vitamin D, vitamin K & vitamin B12 [in strictly vegan mothers].
- All infants should receive 400 IU of vitamin D daily throughout the first year of life.
- All neonates should receive single dose of Vit K 1 mg dosage intramuscularly at birth to prevent hemorrhagic disease of newborn.

vi. Water Content

- Breast milk has 88% water approximately equal to cow's milk
- This water content is adequate to meet the demands of baby in 1st 6 months

2. Breast milk contains certain substances that protect the baby against infection

- **P** - **P**hagocytic macrophages
- **P** - **P**ABA [para amino benzoic acid]
- **L** - **L**actoferrin
- **L** - **L**ysozyme
- **A** - **A**ntibodies especially IgA
- **A** - **A**nti-staphylococcal factor
- **B** - **B**ifidus factor
- **B** - **B**ile stimulated lipase

How to remember

- $(P\ L\ A\ B)_2$

3. Breast milk protects against diseases like

- Neonatal period: NEC, neonatal sepsis
- Later in life: obesity, HTN, diabetes, allergies, asthma, dental caries

4. Breast Milk fed babies have higher IQ.

5. Breast milk helps in maternal and child bonding.

6. Breast milk is safe, free from contamination, easily available even in resource limited settings.

Variations in the composition of breast milk 00:46:35

I. Depending on Time After Birth

A. Colostrum

- During the 1st 72 hours after the birth of the baby
- Thick, yellowish colored milk
- Produced in small quantity
- Rich in immunoglobulins, macrophages, proteins
- Known as 1st immunization of the baby
- Contains lesser lactose (so less sweeter) than normal breast milk

B. Transitional Milk

- During the next 2 weeks
- Composition is in between colostrum & mature milk

C. Mature Milk

- Thin & watery
- Richer in lactose (more sweeter) than colostrum
- Poorer in proteins

II. Depending On Gestational Age

- Preterm Breast milk richer in
  - **S** - **S**odium
  - **I** - **I**mmunoglobulins
  - **P** - **P**roteins
  - **F** - **F**at
  - **I** - **I**ron
  - **C** - **C**alories
- But has lesser lactose.

How to remember

- S I P For Intelligent CNS

III. Depending on Each Feeding Session

Fore Milk	Hind Milk
• At the beginning of a feed • More thin & watery • Satisfies mainly the thirst of the baby	• At the end of a feed • More thicker and calorie dense • Richer in fat • Satisfies the hunger of the baby

CLINICAL QUESTIONS

Q. In a CME conducted at a medical college all departments were supposed to present a seminar on topics related to maternal and neonatal care. Department of Pediatrics presented a seminar on benefits of Breast milk. While giving the seminar they informed about the benefits of higher lactose content of breast milk. Which out of the following did they not mention in the benefits?

A. Helps in formation of galactocerebrosides
B. Helps in absorption of calcium
C. Helps in decreasing the risk of infections
D. Helps in increasing the growth of lactobacilli

Answer: C

Solution:

Benefits of higher lactose content of breast milk:

- The galactose helps in formation of galactocerebrosides.
- Lactose helps in absorption of calcium
- Increase growth of lactobacilli in the intestine.

Risk of infections is decreased due to anti-infective substances like:

- Phagocytic macrophages
- PABA
- Lactoferrin
- Lysozyme
- Antibodies especially IgA
- Bifidus factor

Reference: Ghai 9th ed pg 145

Q. Mother visited the doctor with complaint that she has been feeding her child for one month continuously after birth & suddenly she started noticing that production of her breast milk is reduced. Doctor explains the certain factors for the reduction of breast milk that include all of the following, EXCEPT?

A. Sound of baby
B. Use of pacifiers
C. Formula feeding
D. Lack of night feeding

Answer: A

Solution

Factors which ↑ breast milk production: the thought, sight or **sound of baby**

Factors which ↓ breast milk production:

- Use of dummies, pacifiers
- Feeding bottles, formula feeding
- Sore or cracked nipples
- Lack of night feeding & inadequate emptying of breast.

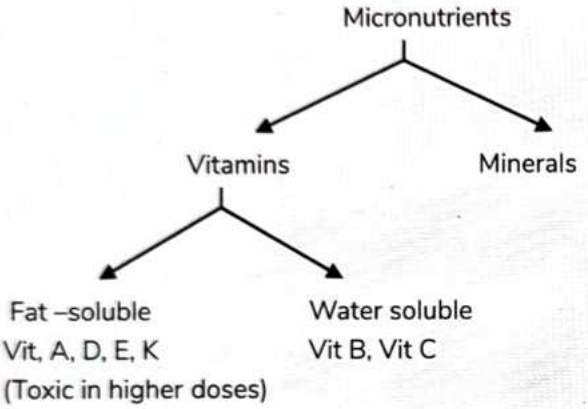
Reference: Ghai 9th ed pg 146

28 MICRONUTRIENTS IN HEALTH & DISEASE

What are micronutrients? 00:00:30

- Substances needed in miniscule amounts by the body to help in production/ action of various enzymes, hormones & other substances essential for paper growth, development & functioning of the body.

Classification 00:02:15



VITAMIN A 00:04:20

1. Normal function: It is essential for

- Normal vision
- Reproduction
- Embryonal & neonatal development
- Cell & tissue differentiation.

2. RDA of Vit A: (Recommended Dietary allowance)

- Age: µg Retinol equivalents/ day
- Infancy: 400 - 500
- Children: 300 - 600
- Adolescent: 600 – 900

3. Dietary sources

- As retinyl palmitate (In animal sources): meat, fish oil, milk
- As carotenoids (in plant sources): yellow orange veg (carrot, pumpkin) & green Leafy veg (spinach, broccoli)

4. Clinical features of Vit A deficiency

- **Epithelial changes**: dry, scaly, hyperkeratotic patches on arms, shoulders, legs & buttocks. (toad like skin)
- **Eye lesions (WHO classification)** 00:09:50
  - XN - Night blindness (1st symptom of Vit A def.)
  - XIA - Conjunctional xerosis or dryness (1st sign of Vit A def.)
  - XIB - Bitot's spots.
  - X2 - Corneal xerosis
  - X3A - Corneal ulceration or keratomalacia involving $^1/_3$ of cornea
  - X3B - Corneal ulceration/ keratomalacia involving > $^1/_3$ of cornea.
  - XS - Corneal scars

5. Rx of Vit A deficiency 00:13:43

Age	Oral Vit A dose
< 6 months	50,000 IU
6 - 12 months	1,00,000 IU
> 1 year	2,00,000 IU

- Dose is given stat, repeated next day & 4 weeks later

6. Hypervitaminosis A 00:15:20

- Due to excess intake of Retinol (> 6000 µg/ day) for several weeks or single 30-60 mg dose
- Pseudotumor cerebri (Headache, vomiting, irritability, bulging fontanelle, papilledema), itchy/ desquamating skin, hepatosplenomegaly.
- X ray- Hyperostosis of long bones, in chronic cases
- Vit A during pregnancy: Cong. Abnormalities & Spontaneous abortion

7. National Vit A prophylaxis Program 00:18:10

- Prophylactic Vit A given to all children starting at 9 months age: 9 mega doses
  - 1st - 9 months
  - 2nd - 18 months &
  - There after every 6 months, till 5 yr age.

VITAMIN B COMPLEX 00:19:26

1. Normal function

- As coenzymes in enzymatic reactions involving metabolism of carbohydrates amino acids & nucleic acids

Refer Table 28.1

2. **RDA, dietary sources & causes of deficiency** 00:20:08

3. **Clinical features due to Vit B deficiency**

- **Thiamine Deficiency: Beriberi**
  - Dry Beriberi: Peripheral neuritis, paralysis of lower links, absent DTRs.
  - Wet Beriberi: CCF, edema
  - Infantile Beriberi: Cardiomegaly, cyanosis, dyspnea

- **Riboflavin deficiency**

1	Glossitis
2	Cheilosis
3	Angular stomatitis
4	Seborrheic dermatitis around nasolabial folds
5	Photophobia

- **Niacin deficiency: Pellagra** (4D's)
  - Dermatitis: Casal's necklace
  - Diarrhea
  - Dementia, headache, apathy
  - Death

- **Pyridoxine deficiency**
  - Neonatal/ Infantile: Seizures refractory to antiepileptics
  - **Older children:** peripheral neuropathy, anemia, dermatitis

- **Cobalamin deficiency**
  - Megaloblastic Anemia & thrombocytopenia
  - Subacute combined degeneration of Spinal cord.

- **Folate deficiency**
  - Megaloblastic Anemia, growth restriction, glossitis,
  - During pregnancy: Neural tube defects in baby

- **Biotin**
  - Periorificial scaly dermatitis
  - Alopecia
  - Conjunctivitis
  - Glossitis
  - Anorexia, vomiting

VITAMIN C

00:38:39

1. **Normal function**

- Helps in formation of collagen
- Maintenance of normal connective tissue
- Wound heeling
- Bone (osteoid) formation
- Help in Fe absorption by reducing $Fe^{3+} \rightarrow Fe^{2+}$ in gut.

2. **RDA**

- Infant: 30 - 40 mg/day
- Children: 40 – 70 mg/day

3. **Dietary sources**

- Citrus fruits eg orange, lime
- Veg eg cabbage, cauliflower, cucumber, spinach
- Breast milk contains adequate Vit C for the baby

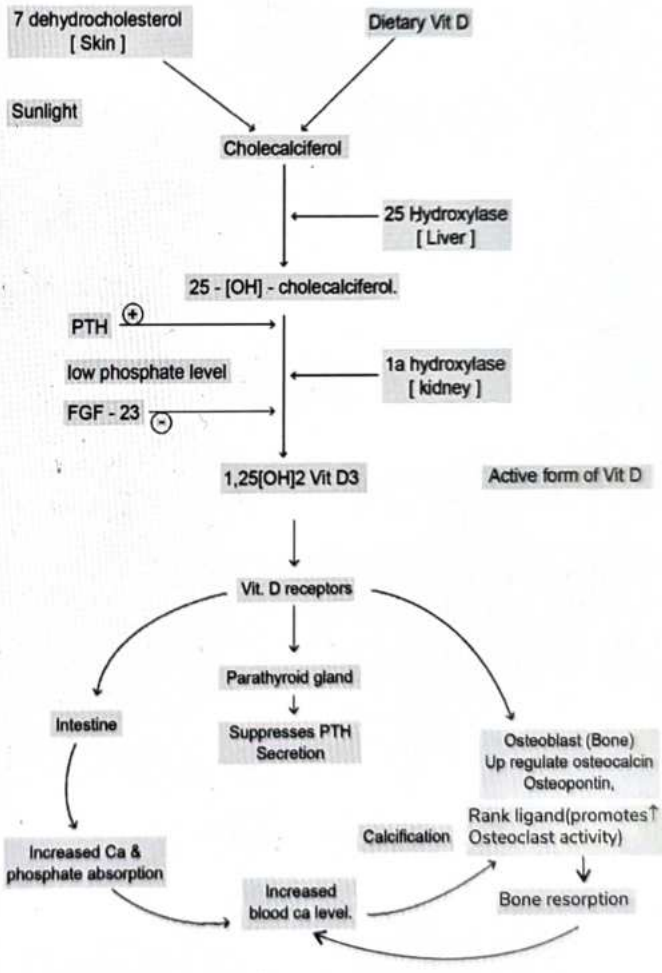
4. **Deficiency:** Scurvy

5. **Rx:** 100 – 200 mg orally daily

VITAMIN D

00:42:54

1. **Normal physiology/ function of Vit D**



Important Information

- Breast milk: 40 IU/ L

2. **RDA of Vit D**
- Infants: 400 IU (10 µg) per day
- Older children: 600 IU (15 µg) per day

3. **Sources of Vit D**
- Exposure to sun light
- Fish oil, egg yolk.
- Vit D fortified milk, cereals, bread

4. **Clinical features:** Rickets

5. **Hypervitaminosis D:** effect due to hypercalcemia
- CNS: Confusion, psychosis, coma
- Cardiac: Hypertension, arrhythmias
- GI: Constipation, pain abdomen
- Kidneys
  - Impaired renal concentration mechanism: polyuria & dehydration
  - Nephrolithiasis & or Nephrocalcinosis: AKI or CKD

Rx of Hypervitaminosis
- Fluid therapy (hydration)
- furosemide
- Bisphosphonates
- Calcitonin
- Steroids

VITAMIN E

00:57:57

1. **Function:** Antioxidant

2. **RDA** (1mg tocopherol = 1.5 IU)
- Preterm infant: 15 – 20 µg
- Term infant: 0.4 mg/ kg body wt/ day
- Children: 3 – 6 µg (5 – 10 IU) day

3. **Dietary sources**: veg oils, seeds nuts, green leafy vegetables

4. **Causes of Vit E deficiency**
- Preterm infants
- Severe malnutrition
- Fat malabsorption
- Cystic fibrosis
- Cholestatic Liver Disease

5. **Clinical features**
- Cerebellar disease } Loss of DTRs
- Posterior column dysfunction } f/b limb ataxia
- Retinal disease

VITAMIN K

01:01:28

1. **Normal function:** Acts as a cofactor for ɤ-glutamyl carboxylase, that performs post translation carboxylation of coagulation factors II, VII, IX, X, which are essential for the coagulation cascade to operate.

2. **Sources of Vit K**
- Vit K_1 (Phylloquinone): Veg oils, seeds, nuts, green leafy veg
- Vit K_2 (menaquinone): Synthesised by intestinal bacteria

3. **RDA**
- Newborns: 3 to 5 µg/ day
- Older children: 10 – 30 µg/ day

4. **Deficiency of Vit K**
- Neonates: Hemorrhagic ds of newborn (vit K deficiency bleeding)
- Older children: Bruising, mucocutaneous bleeding
- Investigation: Both PT & aPTT prolonged
  - In milder cases, elevated level of PIVKA (Proteins induced in Vit K absence)

5. **Rx of Vit K deficiency**
- Neonates: 1 mg Vit K inj. IM
- Older children: 2.5 – 5 mg
  ↓
  PT should decrease within 6 hr of Vit K, and normalises within 24 hrs
- For severe, life threatening bleeds: FFP infusion (fresh frozen plasma)

6. Vit K toxicity may be seen, especially in preterm neonates can precipitate Neonatal jaundice

IMPORTANT MINERALS

Iron

01:09:27

1. **Dietary sources**
- Veg- spinach, beans, broccoli, nuts, jiggery, lentils, soybean, tofu.
- Animal: meat, sea food, eggs.
- Cooking food in iron utensils

2. **RDA of Iron**
- 1 – 9 yr : 6 – 11 mg/ day
- Adolescent: 11 – 19 mg/ day

3. **Deficiency**: Iron deficiency Anemia

Calcium

01:11:39

1. **Normal functions**
- Coagulation cascade
- Nerve conduction
- Muscle function
- Hormone secretion

2. **Dietary sources of Ca**
- Milk, yoghurt, cheese.
- Nuts, legume, veg eg spinach, cabbage, broccoli
- Fortified food items.

3. **RDA for Ca**
- Infant: 200 – 260 mg/ day
- 1 – 10 yrs : 500 – 800 mg/ day
- Pubertal growth spurt: 1000 – 1200 mg/ day

4. **Deficiency of Ca:**
- Rickets
- Seizures, irritable
- Neonates: poor feeding, apnea, jitteriness
- Older children: Tetany, numbness & tingling of limbs

5. **Rx**
- Acute: Inj. Ca gluconate
- Long term: Oral calcium

Zinc 01:16:02

1. **Normal function**
- Helps in > 200 enzymatic reactions
- As a component of zinc finger proteins
  - Regulates gene transcription
  - Participates in nucleic acid metabolism
  - Protein synthesis
  - Cell growth
- It is a part of superoxide dismutase: antioxidant action

2. **Dietary sources**
- Mainly from animal service
- Veg: Nuts
- Dietary phytates decrease bioavailability of zinc

3. **RDA**
- for normal children: 3.5 – 5 mg/day
- Malnourished children: 2 – 4 mg/ kg/ day

4. **Causes of zinc deficiency**
- Infants & adolescents
- Malnutrition & Malabsorption
- Recurrent/ chronic diarrhea
- Prolonged IVF or TPN

5. **Clinical features of Zinc deficiency**

i. Acrodermatitis enteropathica
- AR disorder due to defect in SLC 39 A4 gene

↓

Impaired zinc absorption in intestine.
- Presents in early infancy with
  - Vesico bullous, day, scaly or erythematous or eczematous lesions, mainly in periorificial areas (around mouth & perineum) & acral areas
  - Alopecia & eye changes like conjunctivitis, blepharitis & photophobia

ii. Poor physical growth, alopecia, anemia, diarrhea, poor wound healing & impaired immune function

iii. Delayed sexual maturation & hypogonadism in adolescents

6. **Treatment:** zinc supplementation
- Inherited: 3 mg/ kg/ day
- Acquired: 0.5 – 1 mg/ kg/ day

Iodine 01:24:54

1. **Normal function:** Essential for formation of thyroid hormones,
- Body growth } Especially in fetus
- Bone development } & 1st 3 yrs of life.

2. **Dietary sources**
- Sea food/ plants
- Uncooked iodised salt
- Dairy products (milk, yoghurt, cheese)

3. **RDA of Iodine**
- Birth to 5 yr age: 90 µg/ day
- 6 to 12 yr: 120 µg/day
- Adolescent & adults: 150 µg/day

4. **Features of Iodine deficiency**
- Fetus: Abortion, still births, cong. Anomalies & increased perinatal mortality.
- Neonates & infants: Hypothyroidism, goitre
- Children: Goitre, impaired mental function, retarded physical development, hypothyroidism

5. **Prevention of Iodine Deficiency**
- 'National Iodine deficiency disorders control program'

↓

Previously known as 'National Goitre control program
  - Universal iodization of salt recommended.
  - Target Iodine content of salt
    → 30 ppm at manufacturing level
    → 15 ppm at distribution level

IMAGES

Marasmus

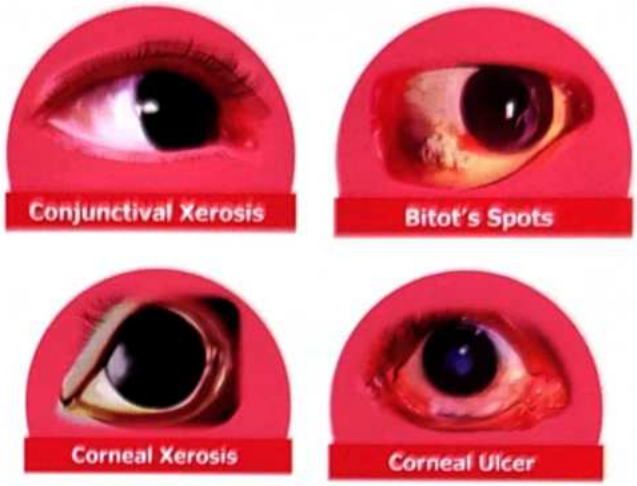
Vit A deficiency



Bitot spot

Clinical features of Vit B deficiency

Oral ulcers | Glossitis

Angular stomatitis | Casal's necklace

Table 28.1

Vitamin	RDA	Dietary sources	Causes of deficiency
Vit B1 (Thiamine)	0.4 mg/ 1000 kcal	Unpolished rice, oats, wheat, legumes, meat	• Predominantly polished rice intake • GI or Liver diseases
Vit B2 (Riboflavin)	0.4 – 1.2 mg/ 1000 kcal	Milk, legumes, Leafy veg, meat.	• Severe malnutrition • Malabsorption
Vit B3 (Niacin)	6 – 8 mg/ mg 1000 kcal	Milk, legumes, green Leafy veg, meat	• Predominantly maize based diet
Vit B6 (Pyridoxine)	0.3 – 1 mg	Banana, wheat, germ, rice, sunflower seeds.	• Prolonged Rx with INH or Penicillamine
Vit B12 (Cobalamin)	0.3 – 0.5 µg	Milk, meat, eggs	• Vegan diet, crohn ds, IF deficiency
Folate	0.5 – 1 mg	Green veg, Citrus fruits, Papaya	• Malnutrition, malabsorption, preterm babies, those on AEDs.
Biotin	1 -10 mg	Fruits, organ meats.	• Raw egg intake, on TPN

CLINICAL QUESTIONS

Q. A three day-old term infant born at home, breast-fed exclusively, presented with lethargy, bulging fontanel, and bright red blood from rectum. What is the most likely etiology of his disease?

A. Fluoride deficiency
B. Calcium deficiency
C. Vitamin K deficiency
D. Iron Deficiency

Answer: C

Solution:

- Vit K deficiency is associated with hemorrhagic disease of newborn which has manifested in this baby as Intracranial hemorrhage (bulging fontanel) and GI bleed (blood per rectum).
- Moreover, home delivery (Vit K may not have been given at birth) and exclusive breastfeeding (Vit K is deficient in breast milk) clearly point to Vit K deficiency as etiology.
- **Calcium deficiency**: Tetany, rickets, and osteoporosis
- **Iron deficiency**: Iron deficiency anemia is associated with impaired performance in mental and physical functions including physical coordination and capacity, cognitive abilities, and social and emotional development
- **Fluoride deficiency** - Dental caries, osteoporosis

Reference: O. P Ghai textbook of Pediatrics, 9th Ed, page 116-117

Q. A 16 year old girl child was brought by her mother to the pediatric OPD with complains of poor physical growth, she looks pale, there is hair loss and also that she frequently falls ill. Her diet is vegetarian. On examination, her sexual characters were delayed and looking at her blood work up which she had done already, her Hb was 8gm. Which element is deficient in this girl?

A. Calcium
B. Copper
C. Zinc
D. Magnesium

Answer: C

Solution:

Deficiency of zinc can lead to syndrome of growth failure, anemia and hypogonadism.

ZINC:

- Second most common trace element in the body after iron.

- Plays role in gene transcription, nucleic acid metabolism, protein synthesis, acts as a major antioxidant (being part of the enzyme superoxide dismutase)
- Mainly derived from animal protein. Liver, oyster, meat, fish, nuts and eggs are a rich source.
- Zinc Deficiency:
  - Poor physical growth
  - Delayed sexual maturation and hypogonadism
  - Alopecia
  - Anemia
  - Diarrhea
  - Dermatitis
  - Impaired immune function
  - Poor wound healing
  - Skeletal abnormalities
  - Acrodermatitis enteropathica

- Treatment: 0.5-1.0 mg elemental zinc/kg/ day

Copper deficiency: Microcytic, hypochromic anemia unresponsive to iron therapy, depigmentation of hair, neutropenia, neurological problems and osteoporosis
Magnesium deficiency: Irritability, tetany and hypo- or hyper-reflexia and cardiac arrhythmias
Calcium deficiency: Tetany, rickets and osteoporosis

Reference: Ghai 9/e p-122

LEARNING OBJECTIVES

UNIT 7- FLUID AND ELECTROLYTE DISTURBANCES

- **Body composition and acid base balance**
  - TBW
  - Disorders of acid-base balance
- **Disorders of sodium and potassium**
  - Hypo/hypernatremia
  - SIADH
  - Hypo/hyperkalemia
- **Iv fluid in health and disease**
  - Maintenance fluids
  - Fluid requirement in neonates
  - Shock, its types, treatment
  - Burns

29 BODY COMPOSITION & ACID BASE BALANCE

BODY COMPOSITION

Total Body Water [TBW]

00:00:31

- TBW constitutes
  - 90% of body weight in early fetal life.
  - 75% of body weight at the time of birth.
  - 60% of body weight by the end of 1st year of life & remains the same till puberty.

Important Information

- After puberty, males have slightly more total body water than females.
- Preterm neonates have higher TBW than the term neonates.

- TBW is divided into
  1) ECF volume
  2) ICF volume i.e. TBW = ECF + ICF

ECF & ICF Volumes

- In fetus & newborn, ECF> ICF volume
- After birth ECF decreases and ICF increases.
- At around 1 year of age, ECF and ICF approach adult values.

Osmolality

00:04:28

- It is defined as concentration of the solute per unit weight of the solvent. It is expressed as mosm/kg.
- Normal plasma osmolality = 285-295 mosm/kg
- Normal urine osmolality = upto 1200-1400 mosm/kg (reached at or beyond 1 year of age)

Important Information

- Calculation of plasma osmolality = 2[sodium] + glucose/18 + BUN/2.8

Cases

00:07:10

Plasma osmolality	Urine osmolality	Diagnosis
1. increased	Increased	Dehydration/ water deprivation
2. decreased	Increased	SIADH
3. increased	Decreased	DI

DISORDERS OF ACID BASE BALANCE

00:10:00

- Detected through ABG analysis (arterial blood gas)
- Ideal site: Radial artery

- Before hand Modified Allen's Test is done to assess patency of palmar arch
- Blood is drawn using 1ml/2ml syringe.
- ABG sample is processed as soon possible after its collection.

Normal Values

- pH = 7.35 - 7.45
- Pco2 = 35 - 45 mmHg
- pO2 = 80 - 100mmHg
- HCO3 = 22 - 28meq/L

1. Acidosis

00:12:54

- It is pH <7.35
- Causes
  - Metabolic: due to excess HCO_3^- loss or H^+ retention
  - Respiratory: due to CO_2 retention

A. Metabolic Acidosis in Children

00:14:05

- pH< 7.35 due to primary decrease in HCO_3^-
- It is corrected by Respiratory compensation (Acidotic breathing) which begins within minutes and is maximum by 12-24 hrs.

- Expected pCo_2 in metabolic acidosis = $(1.5 \times HCO_3^-) + 8 \pm 2$

- Example: In a pt of metabolic acidosis, the HCO_3^- levels are 10 meq/L. Calculate the expected Pco2.
  Solution: $1.5 \times 10 + 8 +/- 2$
  $= 15 + 8 +/- 2$
  $= 23 +/- 2$
  $= 21 - 25$ mmHg

- Important causes of metabolic acidosis in children
  - High anion gap metabolic acidosis
  - Normal anion gap metabolic acidosis

Important Information

- ANION GAP(AG) = Na - (HCO3 + Cl)
- Normal AG = 8-12meq/L

- **Metabolic Acidosis with Normal Anion Gap (PURDA)**
  - **P** - Post hypocapnia
  - **U** - Urinary tract diversions
  - **R** - Renal tubular acidosis
  - **D** - Diarrhea - most common cause
  - **A** - Ammonium chloride ingestion

How to remember

- PURDA

- **Metabolic Acidosis with increased anion gap**
  - **K** - Keto acidosis, Kidney failure
  - **L** - Lactic acidosis, Liver failure
  - **M** - Malignancy, Medications (Metformin)
  - **T** - Tissue hypoxia (shock)
  - **I** - Inborn errors of metabolism
  - **P** - Poisoning by Ethylene glycol

How to remember

- KaLaM TIP

B. Respiratory Acidosis 00:21:49

- pH <7.35 primarily due to CO_2 retention
- It occurs due to respiratory compromise leading to CO_2 retention due to
  - Decrease in central respiratory drive
  - Paralysis of respiratory muscles (intercostal muscles and diaphragm)
  - Lung parenchymal/airway disease
  - Progressive neuromuscular disease
  - Scoliosis (restrictive lung disease)
- Compensation is by metabolic alkalosis i.e. kidneys compensate by increasing HCO_3 retention/ resorption which begins in 6-12 hours and is maximum by 3-5 days. HCO_3 is resorbed and H ions lost as NH4 ions from the body.
- For every 10 mmHg increase in PCo_2, there is 4meq/L rise in HCO_3.
- Treatment of respiratory acidosis is assisted ventilation (NIV/IMV)

2. Alkalosis

- pH > 7.45 either due to increase in HCO_3^- or loss of H^+ ions

A. Metabolic Alkalosis in Children 00:27:55

- pH >7.45 due to primary increase in HCO_3
- MC causes
  - Vomiting (HCL loss, Relative rise in HCO_3)
  - Diuretics use.
- Types

i. Chloride Responsive metabolic alkalosis

- Urinary chloride < 15 meq/L
- Decrease in ECF volume
- It responds to volume repletion by normal saline.
- **Etiology:** (Cl or fluid loss from Gut/kidney/skin)
  - → Gut losses: vomiting /continuous NG drainage/congenital chloride diarrhoea
  - → Sweat losses: Cystic fibrosis
  - → Kidney losses: Loop diuretics (furosemide) /Thiazides

ii. Chloride Resistant Metabolic Alkalosis

- Urinary chloride >20 meq/L
- Non responsive to volume repletion by normal saline.

Normal BP	High BP
○ Barter syndrome ○ Gitelman syndrome	○ **C** - Congenital adrenal hyperplasia (11 beta hydroxylase/17alpha hydroxylase deficiency) ○ **L** - Liddle syndrome ○ **G** - GRA (Glucocorticoid remediable Aldosteronism) ○ **A** - AME (Apparent mineralocorticoid excess) ○ **D** - Disorders of sexual development ○ **A** - Adrenal Adenoma/carcinoma

How to remember

- CL GADA

Liddle Syndrome 00:34:17

- Autosomal dominant condition
- Due to an activating mutation of Na channel in distal nephron
- These Na channels remain continuously open
- Leading to sodium retention and thus hypertension

Glucocorticoid Remediable Aldosteronism [GRA] 00:35:14

- Autosomal dominant condition
- Aldosterone synthase gene becomes regulated by ACTH.
- **Treatment:** Glucocorticoids → Inhibits ACTH production by pituitary → decreased aldosterone production so hypertension decreases.

Apparent mineralocorticoid excess (AME) 00:37:10

- Due to deficiency of 11 Beta hydroxysteroid dehydrogenase enzyme

↑↑ Cortisol —✕→ ↓↓ cortisone (in kidney)

- Cortisol Has mineralocorticoid activity which leads to hypertension

B. Respiratory Alkalosis 00:38:46

- Primarily due to CO2 washout leading to hyperventilation

- **Causes**
  - High fever
  - Sepsis
  - Bronchial asthma
  - CNS disorders
  - Overventilated of intubated child

- Compensation is metabolic acidosis which begins in few hours but takes few days to establish.

- Clinical features are those of the underlying disease.

- Alkalosis promotes binding of calcium to albumin leading to decreased fraction of ionized calcium in blood.

- So, the child can present with features of hypocalcemia i.e. tingling, paranesthesia's, tetany, seizures, palpitations.

CLINICAL QUESTIONS

Q. 9 years old child in PICU developed sudden respiratory distress and your senior doctor asked you to take Arterial blood gas and the results came out as Respiratory acidosis. It is characterized by primary?

A. Deficit of carbonic acid
B. Excess of carbonic acid
C. Deficit of bicarbonate
D. Excess of bicarbonate

Answer: B

Solution

- Respiratory acidosis is caused by CO_2 retention → excess carbonic acid.
- Respiratory acidosis occurs when the alveolar ventilation falls or when carbon dioxide production is increased so that the arterial partial pressure of carbon dioxide (P_aCO_2) is elevated above the normal range (>45 mm Hg) leading to a blood pH lower than 7.35

Reference: Ghai 9/e p 85

Q. What is the name of this test to be done before drawing an arterial blood gas sample:

A. Virchow test
B. Water hammer test
C. Allen test
D. Trendelenburg test

Answer: C

Solution

Allen's test: Done to assess patency of palmar arch

It measures arterial competency, and should be performed before taking an arterial sample.

- A → Both radial & ulnar artery are occludedto obstruct blood flow to the hand.
- B → Ulnar artery kept occluded, Radial artery released

Other options:

- Water hammer test- to detect water hammer pulse in aortic regurgitation
- Trendelenburg test- to detect weakness of hip abductors

Reference: AIIMS NICU protocol 2019

30 DISORDERS OF SODIUM & POTASSIUM

DISORDERS OF SODIUM

A. Hypernatremia

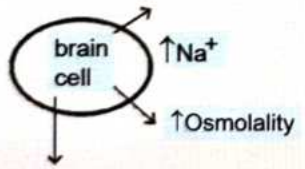
00:00:30

- Serum Na^+ > 145 mg/dl
- Causes

Excess Na^+	Water deficit	Water & Na deficit
• Improper feeds	• DI (Diabetes insipidus)	• GI losses: diarrhea/ vomiting
• IV 3 % NaCl	• Increased insensible loss (Preterm neonates on warmers)	• Cutaneous loss: burns
• $NaHCO_3$	• Inadequate fluid intake	• Renal loss: polyuric phase of ATN
• Hyperaldosteronism		• Osmotic diuresis

Important Information

Q. Most devastating consequence of hypernatremia in children: Brain Hemorrhage (parenchymal / subdural / subarachnoid)



Previous Year's Questions

Q. While treating a child with head injury by giving mannitol, how much osmolarity should be maintained? (JIPMER Nov 2018)

A. < 330 mOsm/L
B. < 335 mOsm/L
C. < 320 mOsm/L
D. < 325 mOsm/L

B. Hyponatremia

00:06:55

- Serum Na+ < 135 meq/L
- Causes

Hypovolemic	Euvolemic	Hypervolemic
• GI/Skin losses	• SIADH	• Heart failure
• Renal losses ○ Diuretics ○ Nephronophthisis ○ ARPKD ○ Obstructive uropathy ○ CSWS (Cerebral salt wasting syndrome)	• Hypothyroidism • Glucocorticoid deficiency • water intoxication	• Cirrhosis • Nephrotic syndrome • Renal failure • Hypoalbuminemia

C. Pseudohyponatremia

00:10:25

- Seen in hyperglycemia, mannitol or sucrose intake

DIAGNOSTIC CRITERIA OF SIADH (SYNDROME OF INAPPROPRIATE ADH)

00:10:58

Presence of

- Serum Na^+ < 135 meq/l
- Serum osmolality < 280 mosm/kg
- Urine Na^+ > 30 meq/L
- Urine osmolality > 100 mosm/kg
- Correction with water restriction

And Absence of

- Renal/adrenal/thyroid insufficiency
- Heart failure/nephrotic syndrome /cirrhosis
- Diuretic ingestion
- Dehydration

DISORDERS OF POTASSIUM

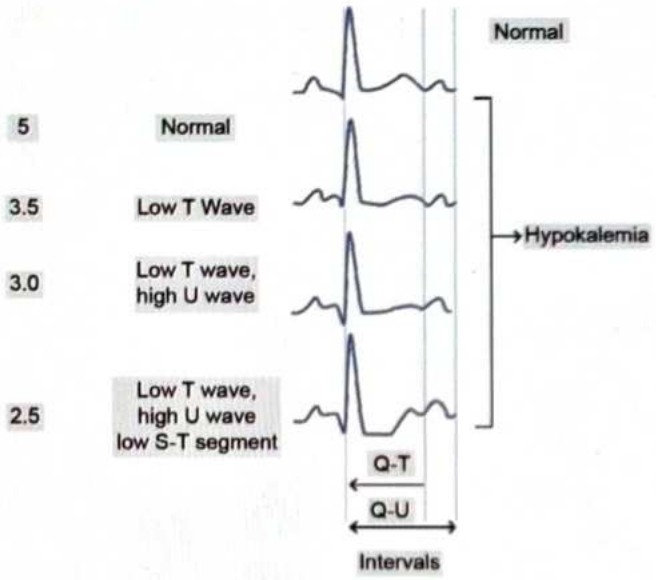
00:14:09

A. Hypokalemia

- Serum K^+ < 3.5 meq/L
- **Etiology**
  - Increased losses eg., diarrhea
  - Decreased stores e.g. malnutrition
  - Shift into intercellular compartment e.g. alkalosis
  - Renal e.g. RTA
  - Endocrine e.g. Cushing syndrome, Hyperaldosteronism.

- **Clinical Features**
  - Muscle weakness
  - Hypotonia
  - Constipation
  - Paralytic ileus
  - Polyurea
  - Polydipsia

- **ECG**
  - ~ 3.5meq/L: Flattening of T-wave (1st sign of ECG)
  - ~ 3meq/L: High U-wave
  - ~ 2.5meq/L: Low ST segment



- **Treatment**
  - K^+ supplementations (oral/iv)
  - iv given
    - → If serum $K^+ < 2.5$ meq/L or
    - → If ECG changes present or
    - → If unable to take orally.

Important Information

- Infusion given via peripheral vascular access should not contain K+> 40meq/L

B. Hyperkalemia 00:19:29

- Serum K^+ level > 5.5 meq/L
- **Etiology**

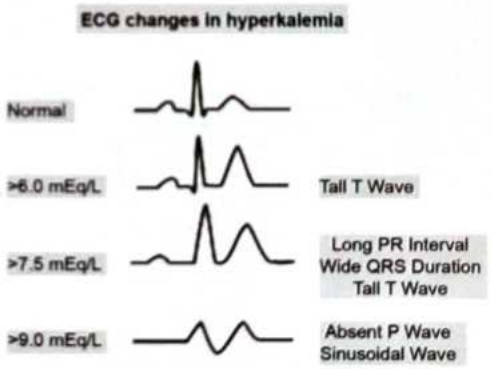
i. Increased Intake – oral/iv
  - Blood transfusion

ii. Spurious Lab value
  - Hemolysis
  - Tissue ischemia during sampling
  - Thrombocytosis/leukocytosis

iii. Transcellular shifts
  - Acidosis
  - Hemolysis
  - Rhabdomyolysis
  - Tumor lysis syndrome
  - Malignant hyperthermia
  - Hyperkalemic periodic paralysis
  - Drugs e.g. digitalis, Beta blockers, succinyl choline.

iv. Decreased excretion
  - Renal failure
  - Addison disease
  - CAH (21 hydroxylase deficiency)
  - Hyporeninemic hypoaldosteronism
  - Pseudo-hypoaldosteronism
  - Sickle cell disease
  - Drugs e.g. ACE inhibitors, Angiotensin receptor blockers

- **ECG changes**
  - 6 meq/L: Tall T waves
  - 7.5 meq/L: long PR internal
    - → Wide QRS
    - → Tall T waves
  - > 8 meq/L: Absent P-waves
    - → Sinusoidal waves



- **Treatment**
  - Mild (5.5-6meq/L): Stop K^+ intake & offending drugs
  - Moderate (6-8meq/L): Inj. Sodium Bicarbonate
    - → Insulin-glucose infusion
  - Severe (>8meq/ L): Inj. Ca gluconate + Rx of moderate Hyperkalemia
  - Refractory Hypercalcemia: Hemodialysis
  - Long term Rx: K^+ binding resins

CLINICAL QUESTIONS

Q. Hypernatremic dehydration in children leads to irritability, restlessness, weakness, lethargy, and fever. What is the most devastating consequence of hypernatremia in children?

A. Seizures
B. Hyperglycemia
C. Brain hemorrhage
D. Hypocalcemia

Answer: C

Solution

- Brain hemorrhage -most devastating consequence of acute & severe hypernatremia.

Due to hypernatremia, extracellular osmolality increases

↓

Osmotic shift of water from neurons- leading to shrinkage of brain

↓

Tearing of meningeal vessels - Intracranial hemorrhage

- Seizures- sequelae to intracranial hemorrhage

Reference: Ghai 9th ed/p- 73

Q. The result of hypokalemia in skeletal muscle includes muscle weakness and cramps. What is the level of Serum Potassium at which paralysis is a possible complication of hypokalemia?

A. Serum Potassium at 5.0 mEq/L
B. Serum Potassium at 2.5 mEq/L
C. Serum Potassium at 3.0 mEq/L
D. Serum Potassium at 3.5 mEq/L

Answer: B

Solution

- The result of hypokalemia in skeletal muscle includes muscle weakness and cramps.
- **Paralysis occurs when potassium levels are <2.5 mEq/L.**It usually starts in the legs and moves to the arms.
- Hypokalemia slows gastrointestinal motility. At potassium levels <2.5 mEq/L, an ileus may occur.

Reference: Nelson 20th ed/ pg-361; O.P. Ghai 9th ed/ pg- 74

31 IV FLUIDS IN HEALTH & DISEASE

HOW TO CALCULATE 24 HR MAINTENANCE FLUID IN CHILDREN? 00:00:18

- For a child, who cannot be fed enterally.
- Calculation of IV fluids for maintenance is calculated by Holiday Segar Method

Body wt.	Fluid	Hourly maintenance fluid rate
For 1st 10 kg	100 ml/ kg	4 ml/kg/hr
Next 10 Kg	50 ml/ Kg	40 ml/hr + 2 ml/kg/hr x (wt - 10 kg)
Beyond 20 Kg	20 ml/ kg	40 ml/hr + 20 ml/hr + 1 ml/kg/hr x (wt - 20 kg)

- **Example**
  Weight of child = 18 Kg
  For 1st 10 kg = 10 X 100 = 1000 ml
  For next 8 kg = 8 X 50 = 400 ml
  So, child needs 1400 ml of IV fluid in 24 hours

- **Example of Hourly Maintenance fluid rate**
  If weight of child = 18 kg
  = 40 + 2 x (18 – 10)
  = 40 + 2 x 8
  = 56 ml/hr

Important Information

- Usual maintenance fluid in children - D5 ½ NS + 20 Meq/L of K+

FLUID REQUIREMENT IN NEONATE 00:06:13

- Based on birth Weight & day of the life (in ml/kg/day)

Refer Table 31.1

Important Information

Q. Which fluid?
- 1st 48 hrs. of life: 10% dextrose alone
- After 48 hrs.: Na+ & K+ added

SHOCK 00:10:00

- **Definition:** An acute syndrome characterized by inability to deliver adequate O_2 to meet the metabolic demands of vital organs & tissue.

- **Types**
  1) Hypovolemic
  2) Obstructive
  3) Distributive
  4) Cardiogenic
  5) Septic

Important Information

- MC cause / type of shock in children – Hypovolemic shock

- Septic shock is a combination of
  - Hypovolemia: Due to capillary leakage
  - Cardiogenic: due to myocardial dysfunction
  - Distributive shock: due to decreased system vascular resistance

- **Compensatory Mechanism In early phases of shock** 00:13:55
  1) Increase in HR
  2) Stroke volume & increase in vascular smooth muscle tone → to maintain B.P & tissue perfusion.

- **Cornerstone of Rx of Septic Shock in Children** 00:14:47
  - Early identification
  - Treatment with appropriate Antibiotics

- **Treatment of child with shock** 00:15:36

0 min: Start high flow O_2 & establish IV/ Intra Osseous access (Tibial)

5 min ↓

i. Push boluses of 20 ml / kg of isotonic/ normal saline NS up to 60 ml/ kg until perfusion improves or rales/ Hepatomegaly appears
ii. Correct Hypocalcemia & hypoglycemia
iii. Begins Antibiotics (broad spectrum)

↓

If still shock not reversed

↓

Fluid Refractory Shock

15 min ↓

i. Begin Inotropes (Dopamine)
ii. Obtain central venous access & airway if needed
iii. If not improving titrate epinephrine (Cold shock) or Norepinephrine (warm shock).

↓

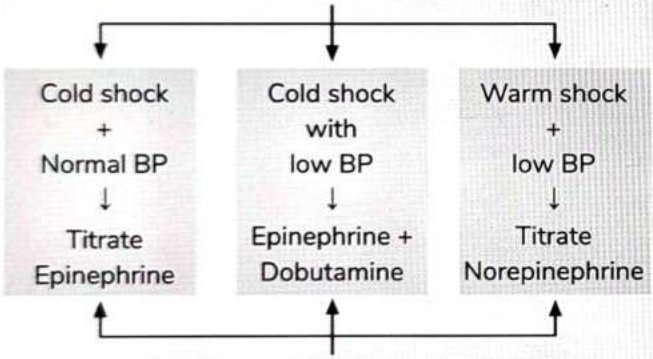
Shock not reversed

↓

Catecholamine Resistant shock

60 min ↓

i. Begin hydrocortisone
ii. Monitor CVP
iii. Maintain normal MAP CVP & $SCVO_2$ > 70%
iv. Maintain Hb> 10gm/dl.



If shock still not reversed

↓

Persistent catecholamine Resistant shock

- Rule out pericardial effusion/ pneumothorax

↓

Shock not reversed

↓

ECMO

(Extra corporeal Membrane oxygenation)

RECENT UPDATES 00:26:06

- Protocolised approach not preferred.
- Individualized approach to suit patient physiology & settings.
- Crystalloids Are Preferred
- "Deresuscitation"
  - Restricting Maintenance fluid after initial resuscitation
  - Use of diuretics
  - Advantage: More ventilation free days & shorter ICU stay (faster recovery)

MONITORING FLUID RESUSCITATION RESPONSIVENESS 00:28:52

- Poor predictors: HR, SBP, CVP
- Good bedside predictor: Hemodynamic changes by passive leg raising.
- Consistent predictors: respiratory variations in aortic blood flow peak velocity.

BURNS IN CHILDREN 00:31:06

- 'Burns': caused by dry heat
- 'Scalds': caused by wet heat eg hot water/ steam
- MC cause of burns in children 5-14 yr of age: flame injury.
- Scald burn is MC in children < 4 yr age

Indications of hospitalization in burns

- Burns involving > 10% of Body Surface Area.
- 3rd degree burns (full thickness burns involving epidermis, dermis & subcutaneous tissue)
- Electric burns due to high tension wires.
- Chemical burns
- Inhalational injury (regardless of Body Surface Area involved)
- Suspected child abuse or neglect.

Estimation of BSA involved in burns in children

- Varies in different age groups.
- May use BSA (Body Surface Area) charts eg
  - Modified Lund & Browder chart
  - Shriners Hospital Chart, Boston.
- 'Rule of nines' – in adults and children > 14 yrs age.
- In small burns (<10% of BSA), 'rule of palm' may be used → area from the wrist crease to the finger crease (palm) in a child 1% of BSA (body surface area)

Fluid Resuscitation in a Child with Burns 00:37:27

- Parkland Formula: 4ml/ kg/ % BSA burned in 24 hours

↓ ½ in 1st 8 hours

↓ Remaining in next 16 hours

- Fluid of choice: Ringer Lactate
- In the next 24 hours: Reabsorption of edema fluid and diuresis occurs.
  - ½ of the fluid infused in 1st day
  - RL in 5% dextrose preferred.

Previous Year's Questions

Q. Not a feature of severe dehydration?
(AIIMS June 2020)

A. Child thirsty
B. Drowsy child
C. Skin retract very slowly
D. Sunken fontanelles

Table 31.1

Birth Weight	D1	2	3	4	5	6	7 & Beyond
<1500gm	80	95	110	120	130	140	150
≥1500gm	60	75	90	105	120	135	150

CLINICAL QUESTIONS

Q. Fire broke out in a slum, after the cylinder bursted and it was fire all over. Fire brigade, NDRF personnel's and ambulance arrived area of causality and recovered as many people as they could. A chaos was all over the place. The district hospital was informed and they prepared themselves for the same. How will you as an intern present in the emergency calculate the amount of fluid to be given in case of children based on parkland formula?

A. 4 mL/kg/% TBSA
B. 5 mL/kg/% TBSA
C. 6 mL/kg/%TBSA
D. 8 mL/kg/% TBSA

Answer: A

Solution

- In children with burns, Parkland formula is an appropriate starting guideline for fluid resuscitation (4 mL lactated Ringer solution/kg/% TBSA burned)
- (TBSA – Total body surface area)
- Half of the fluid is given over the 1st 8 hr; the remaining half is given in the next 16 hours

Reference: Nelson textbook of Pediatrics, 20th Ed, page 572

Q. You are a second year student attending your pharmacology practical class under 2nd year resident. She teaches you to make ORS which is Low osmolar. What should be the Sodium concentration and total osmolarity of in this ORS?

A. Na 90 mEq/L ; 311 mOsmol/L
B. Na 75 mEq/L ; 245 mOsmol/L
C. Na 60 mEq/L ; 245 mOsmol/L
D. Na 60 mEq/L; 240 mOsmol/L

Answer: B

Solution

Component	Low Osmolarity WHO ORS (mEq/L)
Glucose	**75**
Sodium	75
Potassium	20
Chloride	65
Citrate	10
Osmolarity	**245 mosm/l**

Reference: Ghai 9/e p 289

LEARNING OBJECTIVES

UNIT 8 GENETICS AND GENETIC DISORDERS

- Types of genetic disorders
  - Classification of genetic disorders
  - Mendelian disorders
  - Non mendelian disorders

- Imp genetic syndromes
  - Down syndrome
  - Turner syndrome
  - Some Trisomies
  - Noonan syndrome

32 TYPES OF GENETIC DISORDERS

CLASSIFICATION

00:01:00

I. Single gene disorders (Mendelian disorders)

- Single gene is altered
- Follow Mendelian mode of inheritance
- E.g.: Hemophilia

II. Non-mendelian disorders

- Trinucleotide repeats
- Mitochondrial inheritance
- Genomic Imprinting
- Gonadal Mosaicism

III. Multifactorial disorders

- Results from a combination of multiple genetic & environmental causes
- E.g.: Cleft palate, Neural tube defects

IV. Chromosomal disorders

- Entire chromosome or their segments are
  - Missing
  - Duplicated or altered
- Can affect chromosomal number or structure
- E.g.: Down's syndrome or Turner syndrome

MENDELIAN DISORDERS

00:0550

Autosomal Dominant Disorders (AD)

- Manifest even if only one of the alleles of the abnormal gene is affected
- At least 1 Parent is affected

- **Examples**
  - **H** - **H**ypercholesterolemia, **H**ereditary spherocytosis
  - **E** - **E**hlers Danlos syndrome
  - **A** - **A**chondroplasia
  - **V** - **V**on Willebrand disease
  - **Y** - Pseudoh**Y**poparathyroidism
  - **D** - **D**ystrophia Myotonica
  - **O** - **O**steogenesis Imperfecta
  - **M** - **M**arfan syndrome
  - **I** - **I**ntermittent porphyria
  - **N** - **N**oonan's syndrome
  - **A** - **A**denomatous polyposis coli
  - **N** - **N**eurofibromatosis 1 and 2
  - **T** - **T**uberous sclerosis

How to remember

- HEAVY DOMINANT

Previous Year's Questions

Q. A newborn girl presents with severe purpura fulminans. Family has history of 1-year old male died of severe purpura fulminans. Other 2 siblings are normal. What is the diagnosis?

(JIPMER Nov 2018)

A. Hemophilia A
B. Protein C deficiency
C. ITP
D. VWD

Autosomal Recessive Disorders (AR)

- Manifest only if both the alleles of a gene are affected
- Examples
  - **A** - **A**lbinism, **A**lkaptonuria
  - **B** - **B**eta Thalassemia
  - **C** - **C**ystic fibrosis, **C**ongenital Adrenal hyperplasia
  - **D** - **D**eafness (Sensorineural)
  - **E** - **E**mphysema ($\alpha - 1$ antitrypsin deficiency)
  - **F** - **F**riedrich's ataxia
  - **G** - **G**aucher disease, **G**alactosemia
  - **H** - **H**omocystinuria

How to remember

- A B C D E F G H

X- Linked Recessive Disorders (XLR)

- Males are MC affected
- All daughters of an affected male are carriers but all sons are normal
- Father to son transmission rules out x- linked inheritance.

- Examples
  - G - G6PD deficiency
  - D - Duchenne muscular dystrophy
  - C - Color blindness
  - F - Fragile - X – syndrome, Fabry disease
  - C - Chronic granulomatous disease (CGD)
  - H - Hemophilia A & B, Hunter disease
  - A - Agammaglobulinemia
  - W - Wiskott-Aldrich Syndrome
  - A - Albinism
  - L - Lesch-Nyhan syndrome

How to remember

- Girls Do Care For CHAWAL

X- Linked Dominant Disorders (XLD)

- All daughters, but no sons of an affected male have the disease
- Examples
  - C - Charcot-Marie-Tooth disease
  - A - Airport syndrome
  - R - Rett syndrome
  - R - Hypophosphatemic Rickets

How to remember

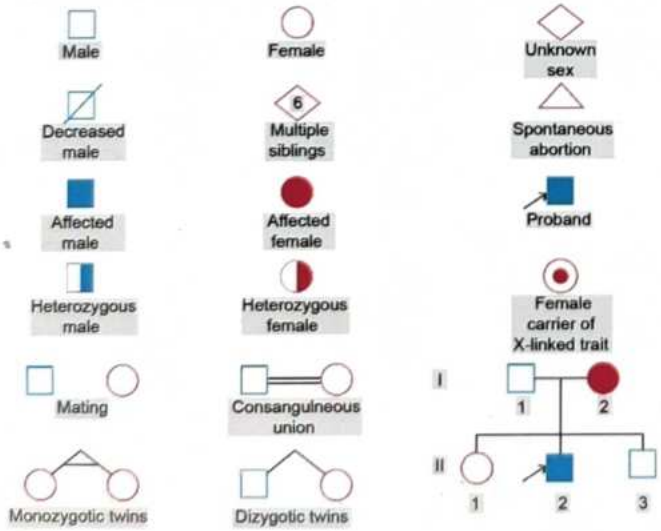
- CARR

INTERPRETATION OF PEDIGREE

00:22:44

1. In a dominant inheritance, at least 1 parent of the affected child will be diseased.
2. Father to son transmission rules out X linked inheritance.
3. If all or most of the children of an affected female are diseased, it is mitochondrial inheritance.

Important symbols used



Refer Table 32.1

Pattern	Inheritance
All or most children of a mother are affected	Mitochondrial
If at least one of the parents always have the disorder	Dominant
If neither parents has the disorder because they are heterozygous	Recessive
If both males and females are affected, with almost equal frequency	Autosomal
Father to son transmission of trait does not occur	X linked
More males affected: affected sons usually born to unaffected mothers	X linked recessive
More females affected: affected sons must have an affected mother	X linked dominant

NON-MENDELIAN DISORDERS

00:34:34

I. Trinucleotide Repeat Disorders

- Due to ↑ in no. of Trinucleotide repeats, above a certain threshold
- Number of Repeats usually correlates with the severity the Disease
- Anticipation Phenomenon is seen
  - Disease manifestation worsen from 1 generation to the next or it may be observed at an earlier age due to increase in number of Repeats with successive Generation

Examples	Repeats
Fragile-X-Syndrome	CGG
Dystrophia Myotonia	CTG
Huntington Disease	CAG

Fragile - X - Syndrome

00:39:30

- **Gene involved**: FMR 1 (Familial Mental Retardation-1) on Chromosome- X
- 2nd MC Genetic Cause of Intellectual Disability after Down's Syndrome
- **Genetic Basis**
  - Normal Population: 5-55 CGG repeat
  - Carriers: 55-200 (premutation stage)
  - Fragile X syndrome: > 200 Repeats

- **Clinical Features**
  - Long face
  - Hyper extensible joints
  - High Arched Palate
  - Mitral Valve Prolapse
  - Large Mandible
  - Large Ears
  - Large testis / Macro-orchidism (In post-Pubertal Males)

Previous Year's Questions

Q. True about Fragile X syndrome is? (NEET Jan 2019)

A. Triple nucleotide CAG sequence mutation
B. 100 female carriers mentally retarded
C. Males have IQ 20 - 40
D. Gain of function mutation

II. Mitochondrial Disorders

00:43:20

- Mitochondrial DNA present in cytoplasm
  - Exclusively derived from ovum of mother because only head of sperm (from father) contribute in zygote formation
  - All/ most sons & daughters of affected female have the disease.
- **Heteroplasmy:** Presence of both Wild Type (Normal) and Mutated Mitochondrial DNA in same Individual.
- **Threshold Effect:** Minimum Percentage of mutant Mitochondrial DNA, that must be present in a cell for the disease to occur is called Threshold Effect or "Threshold of expression"
- Examples
  - **K** - Kearn sayre syndrome
  - **L** - Leber hereditary optic neuropathy
  - **M** - MELAS
    - → Mitochondrial Encephalo-myopathy
    - → Lactic Acidosis
    - → Stroke like episodes
  - **M** - MERF
    - → Myoclonic epilepsy
    - → Ragged red fibers in muscle
  - **N** - NARP
    - → Neuropathy
    - → Ataxia
    - → Retinitis pigmentosa
  - **O** - CPEO (Chronic Progressive External Ophthalmoplegia)
  - **P** - Pearson syndrome

How to remember

- K L M N O P

Previous Year's Questions

Q. An affected male does not have affected children but affected female always has affect children. Type of inheritance? (AIIMS May 2019)

A. X - linked recessive
B. Autosomal recessive
C. X - linked dominant
D. Mitochondrial

III. Genomic Imprinting

00:50:28

- Gene Expression depends on the parent of origin of the chromosomes.
- Mostly due to Epigenetic Modification of Gene like Methylation of DNA.
- **Epigenetic Modification:** Alternation in DNA that doesn't Change Nucleotide sequence of DNA
- Examples
  - Prader: Willi Syndrome
  - Angelman Syndrome

Refer Table 32.2

00:53:26

Previous Year's Questions

Q. Child with bouts of laughter. Possible diagnosis?

A. Russel silver syndrome
B. Angelmann syndrome
C. Prader willi syndrome
D. Fragile X syndrome

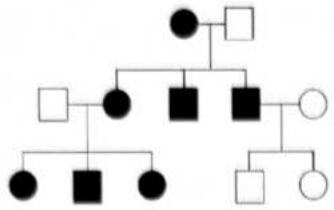
IV. Gonadal Mosaicism

00:58:03

- Due to Mutations that occur Post-Zygotically i.e. after formation of zygote.
- Affects only cells destined to form gonads
- Somatic cells of that person are normal.
- We suspect gonadal mosaicism in a case scenario where more than 1 children are affected with an autosomal Dominant disease like Osteogenesis Imperfecta, But the parents are Phenotypically Normal.

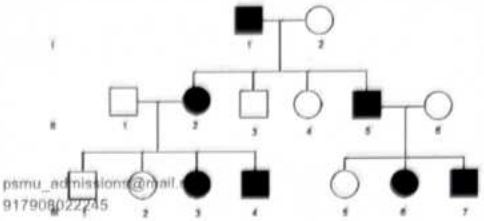
Table 32.1

Diagnosis?

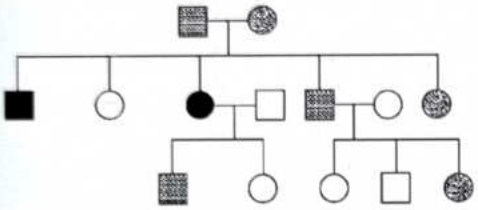


Mitochondrial Inheritance

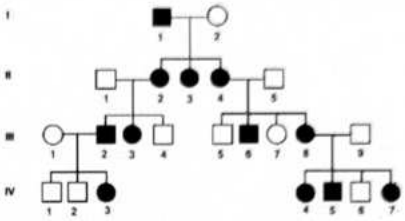
Diagnosis?



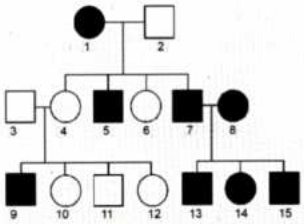
Autosomal Dominant Disorder



Autosomal Recessive inheritance



X-linked Dominant Disorder



X-linked Recessive Pedigree

Table 32.2

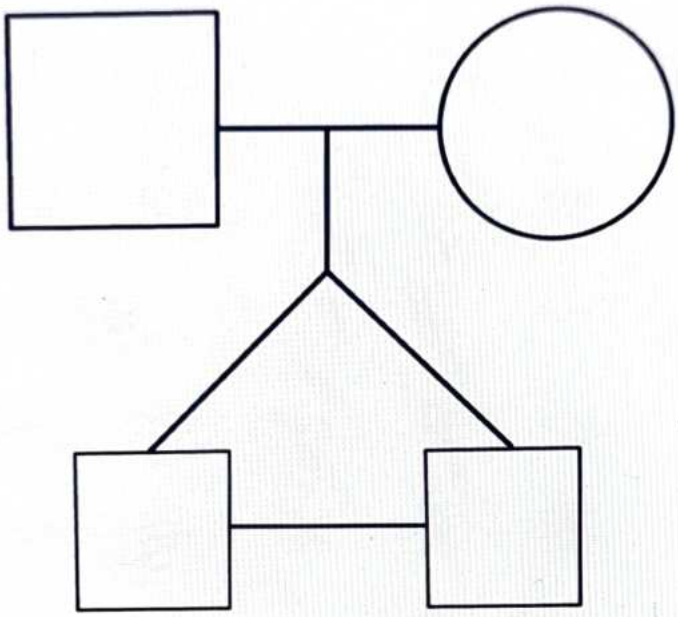
Prader-Willi Syndrome	Angelman Syndrome
• Due to Microdeletion / Silencing of Paternal Copy of UBE 3A gene on Chr.15 or • Due to Maternal Disomy	• Aka Happy Puppet syndrome • Due to Micro deletion / silencing of maternal copy of UBE3A gene or • Due to Paternal Disomy
Clinical Features	**Clinical Features**
• Obesity • Short stature • Intellectual Disability • Hypotonia • Hypogonadism	• **A** - **A**taxia • **N** - **N**ot Intelligent • **G** - **G**TCS (Seizures) • **EL** - **E**xcessive **L**aughter • **MAN** - **M**aternal **G**ene **N**ot there

How to remember

- ANGEL MAN

CLINICAL QUESTIONS

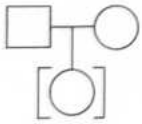
Q. Which of the following is indicated by the pedigree given below?



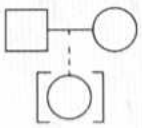
A. Adopted into family
B. Adopted out of family
C. Identical twins
D. Nonidentical twins

Answer: C

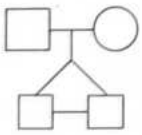
Solution



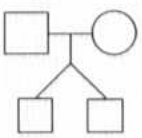
Adopted out of family



Adopted into family



Identical twins



Nonidentical twins

Reference: O. P Ghai textbook of Pediatrics, 8th Ed, page 643

Q. Among the spontaneously aborted fetuses, autosomal trisomies are the most common chromosomal cause. Which among the following is the most common trisomy encountered in spontaneously aborted fetuses?

A. Trisomy 13
B. Trisomy 18
C. Trisomy 21
D. Trisomy 16

Answer: D

Solution

- Among the spontaneously aborted foetuses, autosomal trisomies are the most common chromosomal cause. Within this category, trisomy 16 is the most frequent
- The recurrence risk of trisomy 16 is negligible in subsequent pregnancies

Reference: Nelson textbook of Pediatrics, 20th Ed, page 615

33 IMPORTANT GENETIC SYNDROMES

DOWN SYNDROME

00:00:50

- MC chromosomal abnormality seen in Children
- **Basic defect:** 3 copies of Chr. 21 (Trisomy 21)
- **Genetic basis**
  - 95% - Mc due to Maternal non disjunction
  - 3% - Translocation
  - 1-2% - Mosaicism
- Risk of having a child with down syndrome increases with increase in maternal age.

Mother age	risk of down syndrome
20 yr	1 in 1500
40 yr	1 in 30

- Mc CHD in a child with Down syndrome: Endocardial cushion defects or AVSD (atrioventricular septal defect)
- Mcc of intestinal obstruction in down's syndrome: duodenal atresia
- **Important Features**
  - **I** - Incurved little finger (clinodactyly) / Intellectual disability
  - **C** - Congenital heart disease / Congenital hypothyroidism
  - **A** - Acute leukemia / Alzheimer's disease (early onset) / Atlantoaxial instability/ Absent Moro's Reflex/ Atresia of Duodenum
  - **P** - Protruding tongue
  - **R** - Round face
  - **O** - Occiput flat / Open, wide fontanelle
  - **B** - Brushfield spots on Iris / Brachycephaly
  - **L** - Low (depressed) Nasal bridge, Low tone (hypotonia)
  - **E** - Epicanthic fold / Ears low set & dysplastic
  - **M** - Mongoloid slant (oblique palpebral fissure) of eyes
  - **S** - Simian palmar crease, sandle gap

How to remember

- I C A PROBLEM Somewhere

- Mongoloid slant
- Epicanthic folds
- Depressed Nasal Bridge

Simian crease

Sandle Gap

Clinodactyly

- **Antenatal Screening and Diagnosis** 00:12:35

i. Radiological Markers (Antenatal USG)
  - Increased Nuchal fold thickness (>3 mm): Most sensitive
  - Absent nasal bones
  - Cardiac abnormalities
  - Duodenal atresia
  - Shortened femur

ii. **Biochemical Markers**
  - First Trimester Screening: Dual markers - beta-HCG, pregnancy associated plasma protein (PAPP)
  - Second Trimester Screening
    - → Triple test (β-HCG + AFP + Unconjugated Estriol)
    - → Quadruple test (Triple test + Inhibin A)
    - → Integrated test (Best test for Antenatal Screening of Down Syndrome: Maternal age + T1 (NT > 3 mm + PAPP-A) + T2 (Quadruple test)

Important Information

- 'HI'- HCG and Inhibin Levels increase in Down Syndrome

- **Confirmatory Test for Pre-Natal Diagnosis of Down Syndrome:** Fetal karyotype
  - Done by Obtaining Fetal Genetic material by
    - → CVS
    - → Amniocentesis
    - → Cordocentesis

Method	Gestation
Chorionic villi sampling (CVS)	11-13 weeks
Amniocentesis	14-16 weeks
Cordocentesis (or) Percutaneous Umbilical cord Blood Sampling (PUBS)	17-20 weeks

  - All these 3 Procedures have Increased Risk of Abortion.

Case Scenario 00:22:35

- A Couple Already has a child with Down syndrome. How to predict Recurrence risk of Down syndrome in Next Pregnancy?

Refer Table 33.1

TURNER SYNDROME 00:26:44

- **Basic defect:** 45 XO
- Always seen in Females
- No intellectual disability

- MC CHD: Bicuspid aortic valve (50%) > Coarctation of aorta (30%)

- **Important Features**
  - **S** - Short stature, Sensorineural hearing loss, Short 4th metacarpal
  - **A** - Amenorrhea (Primary)
  - **B** - Barr body absent;

Important Information

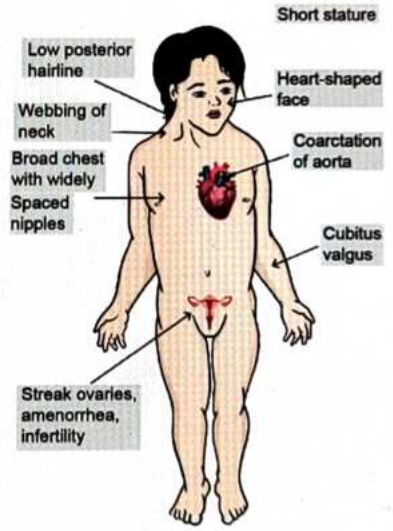
No. of Barr bodies = No of X-chromosome -1

X chromosomes		Barr body
Males	1	1-1=0
Females	2	2-1=1
Turner	1	1 - 1=0

  - **C** - Cardiac anomalies, Cystic hygroma
  - **L** - Lymphedema of Hand and Feet, Low Thyroid
  - **O** - Ovaries Underdeveloped (Streak Ovaries)
  - **W** - Webbed neck
  - **N** - Nipples widely placed, Shield shaped chest

How to remember

- See a Baby Clown



Coarctation of aorta (30%)

Previous Year's Questions

Q. Which of the following is true statement regarding Turner's syndrome? (AIIMS Nov 2018)

A. Turner syndrome with webbed neck is 10 times more likely to develop CVS defects than non webbed neck

B. Coarctation of aorta is more likely in non webbed neck

C. Male turner (Noonan syndrome) is much more likely to have CVS detects

D. Turner syndrome with webbed fingers and toes is likely to be associated with visceral anomalies

Previous Year's Questions

Q. A 10 year old child presented with webbed neck, low posterior hairline, shield chest, short stature and swollen foot. USG abdomen showed small uterus and streak gonads. Identity the diagnosis?

A. Turner syndrome
B. Down's syndrome
C. Klinefelter syndrome
D. Edward syndrome

TRISOMY 18 (EDWARDS SYNDROME)

00:32:49

- R - Rocker bottom foot
- O - Overlapping fingers
- C - Cardiac defects
- K - Kidney malformations
- Y - MicrocephalY
- M - Mental retardation

How to remember

- Rocky Mountain

TRISOMY 13 (PATAU SYNDROME)

00:34:47

Important Features

- C - Cutis aplasia
- M - Microcephaly
- C - Congenital Heart disease, Cleft Lip and Cleft Palate
- O - hOlO prosencephaly
- P - Polydactyly
- D - Developmental delay

How to remember

- CMC OPD

NOONAN'S SYNDROME

00:36:59

- Autosomal dominant
- Normal karyotype (submicroscopic deletions)
- Most common gene: PTPN 11 gene
- Can be seen in both boys and girls

- **Similarities with Turner Syndrome**
  - Webbed neck
  - Short stature
  - Cubitus valgus
- **Differences from Turner Syndrome**
  - Karyotype is normal
  - Autosomal dominant
  - Seen in both boys and girls
  - Intellectual disability not seen in Turner but seen in Noonan syndrome
  - Delayed puberty but fertility is normal whereas infertility seen in Turner syndrome

Important Information

Mongoloid slant
(Down syndrome)

Anti-mongoloid slant
Noonan syndrome

- **MC congenital heart disease in Noonan syndrome:** Pulmonary stenosis (HOCM may be seen)
  - Incidence of Congenital Heart disease in Turner Syndrome is 3 times more common in those with Webbed Neck as compared to those without Webbed Neck.

Previous Year's Questions

Q. Not true regarding Prune belly syndrome?
(JIPMER Nov 2018)

A. Macroglossia
B. Hydroureteronephrosis
C. Anterior abdominal wall defect
D. Cryptorchidism

Previous Year's Questions

Q. A 2-year-old female child, normal at birth, having normal early development, now presents with microcephaly, regression of acquired language and motor milestone along with abnormal stereotypic hand wringing movements. Most likely diagnosis is?
(JIPMER Nov 2018)

A. Angelman syndrome
B. Rett syndrome
C. Asperger syndrome
D. Metachromatic leukodystrophy

Table 33.1

Karyotype of affected child	Karyotype of parents		Recurrence risk
	Father	Mother	
Trisomy 21	N	N	~ 1%
Translocation 21q 21q	N	N	~ 1%
	Either parent carrier		100%
Translocation of Chr 21 with Other Chromosome	N	N	~1%
	Carrier	N	1-3%
	N	Carrier	10-15%

CLINICAL QUESTIONS

Q. CLIP2, ELN, GTF21, and LIMK1 are among the genes that are typically deleted from one chromosome in people with William Syndrome. This hemizygosity for the ELN gene, which codes for the protein elastin, is associated with the connective-tissue abnormalities and cardiovascular disease. Which out of the following is not seen in this?

A. Elfin facies
B. Subvalvular aortic stenosis
C. Hypercalcemia
D. Hypertension

Answer: B

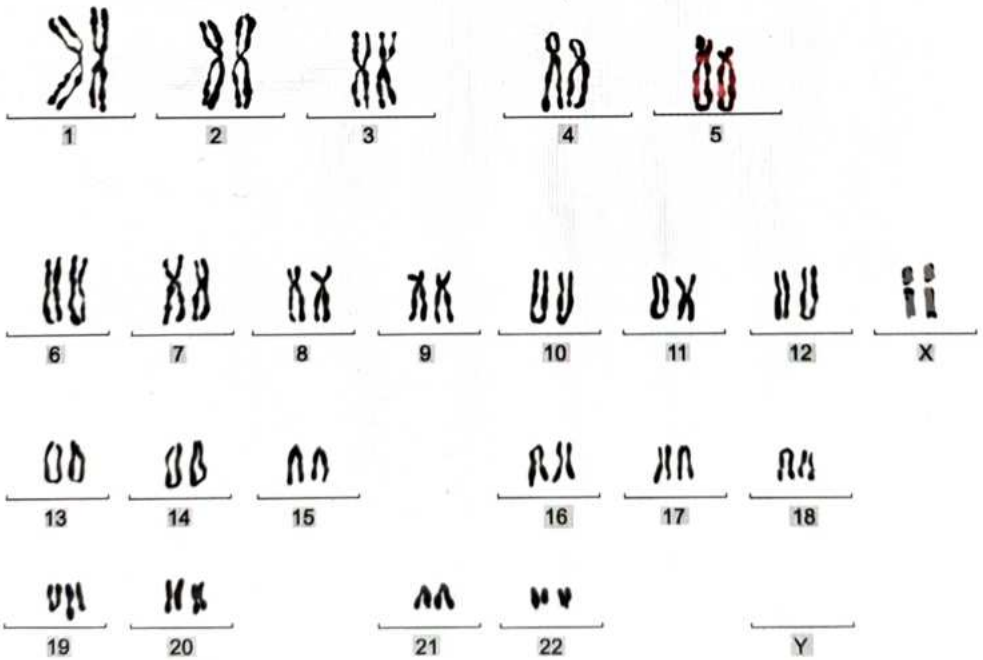
Solution

William's syndrome-

- Supravalvular aortic stenosis
- Intellectual disability
- Short stature
- Hypercalcemia and hypertension
- Face of a child with 'elfin facies' -small upturned nose, long philtrum, wide mouth, full cheeks, full lips, small chin, and puffiness around the eyes.

Reference: Nelson's 21/e p 4242

Q. Identify the disease shown in the karyotype:



A. Cri-du-chat syndrome
B. Bloom syndrome
C. Angelman syndrome
D. Fragile X syndrome

Answer: A

Solution

- In the karyotype, there is deletion of chromosome 5p --> **Cri-du-chat syndrome**
- Also known as Cat Cry Syndrome or **5p minus syndrome.**

CLINICAL FEATURES:

- High-pitched cry that sounds like that of a cat
- Growth failure
- Microcephaly
- Intellectual disability
- Hypertelorism (widely separated eyes)
- Hypotonia
- Hypoplastic nasal bridge

Bloom syndrome:

- It is a Chromosome instability syndrome (chromosome breakage syndrome) with autosomal recessive inheritance
- Increased risk of malignancy [solid tumors (especially of the skin) and lymphoreticular malignancies]
- Erythema and telangiectasia on face after exposure to sunlight
- Immunodeficiency, GI malabsorption and hypogonadism are common

Fragile X syndrome:

- Due to Gene Mutation in the **FMR1 gene on chromosome X**
- **CGG** trinucleotide repeats
- Long face, Hyperextensible joints, High Arched Palate, Mitral valve prolapse,Large Mandible,Large Ears, Large testis/macroorchidism

Angelman syndrome:

- Due to paternal UPD of chromosome 15 (missing the maternal chromosome 15) or genomic imprinting of maternal chromosome 15.
- Seizures, ataxia, mental retardation, inappropriate laughter (happy puppets)

LEARNING OBJECTIVES

UNIT 9 INBRON ERRORS OF METABOLISM

- Disorders of carbohydrate metabolism
  - Suspicion of metabolic disorders
  - Various GSDs
- Disorders of amino acid metabolism
  - Organic acidemias
  - Urea cycle disorders
  - Diseases of phenylalanine pathway
  - Other diseases
- Lysosomal storage diseases
  - MPS
  - NPD
  - Gaucher's disease

34 DISORDERS OF CARBOHYDRATE METABOLISM

WHEN TO SUSPECT A METABOLIC DISORDER? 00:01:28

- **In Neonates & Infants**

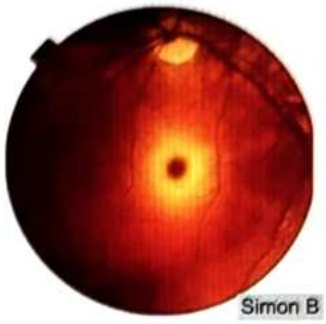
a. Deterioration after a period of apparent normalcy
b. Rapidly progressive encephalopathy +/- seizures
c. Recurrent vomiting; peculiar body fluids / urine odour
d. Sepsis like presentation with negative sepsis screen
e. Significant family history
   - Parental consanguinity
   - Multiple Abortions
   - Siblings with similar illness
f. Investigations: Severe metabolic acidosis, ketosis & hypoglycemia

- **In Older Children**

a. Rapidly progressive encephalopathy +/- seizures
b. Recurrent vomiting; peculiar body fluids / urine odour
c. Significant family history
d. Episodic presentation
e. Worsening with intercurrent Illness
f. Ataxia / Other CNS manifestations
g. Multisystemic Involvement
h. Investigations: Severe metabolic acidosis, ketosis & hypoglycemia

CLINICAL POINTERS FOR SPECIFIC INBORN ERROR METABOLIC SYNDROMES 00:07:22

Clinical finding	Disorders
Coarse facies	Lysosomal disorders (Mucopolysaccharidosis), GM 1 gangliosidosis
Cataract	Galactosemia, Wilson disease, Diabetes mellitus
Retinitis pigmentosa	Mitochondrial disorders
Cherry red spot	GM 1 gangliosidosis, Niemann Pick disease, Tay Sachs disease
Eczema / Alopecia	Biotinidase deficiency, Multiple carboxylase deficiency
Hypopigmentation	Phenyl ketonuria, albinism
Abnormal kinky hair	Menke's disease



Cherry Red Spot

DISORDERS OF CARBOHYDRATE METABOLISM 00:11:30

- Glycogen storage diseases
- Galactosemia
- Hereditary Fructose Intolerance

1. GLYCOGEN STORAGE DISEASES (GSD) 00:12:08

a. Liver glycogenoses

Type	Liver Glycogenoses	Enzyme deficiency
I	Von Gierke disease	Glucose 6 phosphatase
III	Cori disease	Debranching enzyme
IV	Anderson disease	Branching enzyme
VI	Her's disease	Hepatic phosphorylase enzyme

Important Information

- **Muscle may also be involved in Cori's Disease**

b. Muscle Glycogenoses

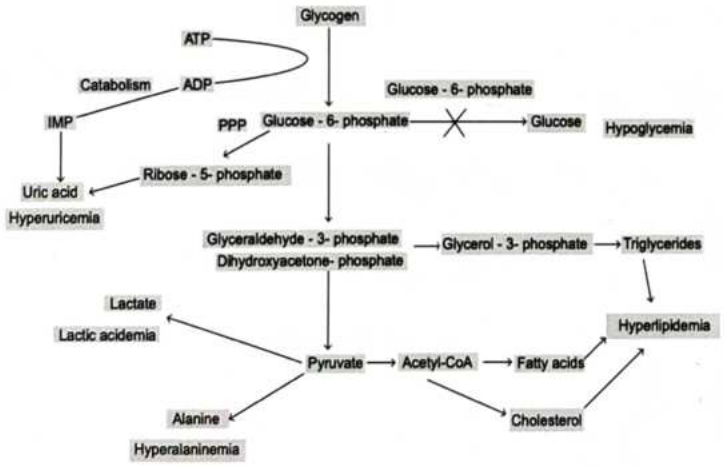
Type	Name	Enzyme Deficiency
II	Pompe Disease	α – 1, 4 Glucosidase or acid maltase
V	Mc Ardle Disease (MC GSD in Adolescents/ Adults)	Muscle phosphorylase
VII	Tarui Disease	Phosphofructokinase

Important Information

- Mc GSD in children: Von Gierke ds
- Mc GSD in adults: Mac Ardle ds

VON GIERKE DISEASE 00:17:47

- Most common GSD in children
- Autosomal recessive
- Type 1a: Glucose 6 phosphatase deficiency
- Type 1b: Translocase deficiency
- **Clinical features**
  - Recurrent Hypoglycemia +/- seizures
  - Hepatomegaly
  - Easy Bruising
  - Doll like facies
- **Investigational findings in von gierke's disease**
  - Hypoglycemia
  - Hyperuricemia
  - Lactic acidosis
  - Hyperlipidemia



- **Definitive Diagnosis**
  - Liver Biopsy
  - Gene based tests
- **Complications**
  - Hepatic Adenomas
  - Pulmonary HTN
  - Renal stones
  - Proteinuria
  - Hypertension
- **Treatment**
  - Frequent feeding
  - Corn starch diet

Important Information

- Both Type I and Type III GSD have Hepatomegaly, Hypoglycemia & Hyperlipidemia

Differences Between Type I & Type III GSD 00:27:40

	Type I GSD	Type III GSD
Kidneys	• Enlarged, spleen normal	• Normal, splenomegaly seen
Muscles	• Not involved	• May be involved
CPK levels	• Normal	• May be elevated
LFT	• Usually normal	• Transaminitis & fasting ketosis present
Lactate	• Elevated	• Usually normal
Effect of glucagon	• No rise in blood glucose, but lactate level rises	• 2 hr after meal - ↑ in blood glucose • After fast – no increase
Liver Biopsy	• Distension of Hepatocytes by Glycogen and Fat	• Fibrosis and Paucity of Fat

POMPE DISEASE 00:31:26

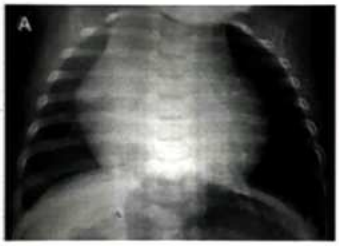
- **Enzyme Deficiency:** Acid Maltase or α-1, 4 Glucosidase
- **Clinical Features**
  - Hypotonia
  - Cardiomegaly

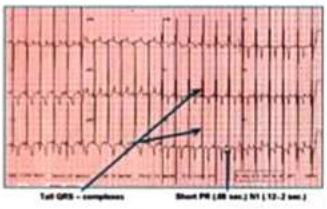
- Hepatomegaly
- Coarse facies

- **Treatment**
  - ERT (Enzyme Replacement Therapy)

Floppy Child

Head Lag





Cardiomegaly

2. GALACTOSEMIA

00:32:59

- Autosomal Recessive
- Deficiency of
  - GALT (Galactose 1 PO4 Uridyl transferase) (MC) or
  - Galactokinase or
  - Epimerase
- Pathophysiology
  - Milk → Lactose → Glucose + Galactose
  - Galactose can't get digested in body due to Enzyme Deficiency
  - Breast feeding is Contraindicated in Confirmed cases of Galactosemia
  - GALT Deficiency: Accumulation of Galactose-1-Phosphate which is Toxic to Kidney, Brain and Liver
  - Galactokinase Deficiency: Accumulation of Galactose and Galactitol which is Toxic to Eye
- **Clinical Features**
  - Jaundice
  - Hepatomegaly
  - Diarrhoea/vomiting
  - Failure to thrive
  - Seizures
  - Intellectual disability
  - Cataract (might be the only manifestation of galactokinase deficiency)
  - Sepsis with E. coli is common in children with Galactosemia
- Duarte Variant of Galactosemia
  - Quite Common
  - Due to Single Amino Acid Substitution
  - 50 % of Normal Enzyme Activity Present
  - These Children usually remain Asymptomatic
  - No Clinical significance of this Condition
- **Diagnosis**
  - Reducing Substances in Urine Positive (detected by Benedict's Test)
  - Direct Enzyme assay
  - Prenatal Diagnosis is also Possible
- **Treatment**
  - Avoid Milk and Milk Products
  - Use Lactose free formulas

3. HEREDITARY FRUCTOSE INTOLERANCE

00:39:24

- Enzyme deficiency: Aldolase-B or Fructose-1,6 Bisphosphate Aldolase
- **Pathophysiology**

  - Due to Aldolase B Enzyme Deficiency, there is accumulation of Fructose 1 Phosphate as Fructose metabolism is Hampered.
  - Fructose 1 Phosphate is toxic to body (mainly Liver)
  - Symptoms appear on intake of Fructose
  - Child has Aversion to sweet food
- **Clinical Features**
  - Jaundice
  - Hepatomegaly
  - hypoglycemia
  - Vomiting
- **Diagnosis**
  - Reducing substance in urine: Positive Benedict's test
  - Assay of Aldolase B activity in Liver
  - Gene based Diagnosis available
- **Treatment**
  - Complete Elimination of sucrose and Fructose from diet

35 DISORDERS OF AMINO ACID METABOLISM

I. Organic Acidemias
- Multiple carboxylase deficiency
- Maple syrup urine disease (MSUD)

II. Urea Cycle disorders

III. Diseases of Phenylalanine Pathway
- Phenylketonuria
- Alkaptonuria
- Tyrosinemia

IV. Others
- Homocystinuria
- Hartnup disorder

ORGANIC ACIDEMIAS

00:01:47

Clinical Features
- Lethargy
- Poor feeding
- Vomiting
- Seizures
- Developmental delay
- Dystonia
- Coma
- Specific odours.

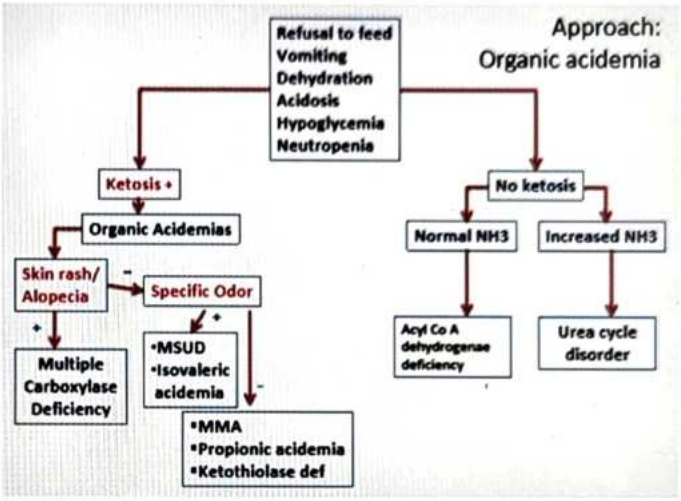
IEM'S with Peculiar Odour

00:02:43

IEM (Disorder)	Urine Odour
Multiple carboxylase	Tomcat
Glutaric acidemia	Sweaty feet
Tyrosinemia	Boiled cabbage
Phenyl ketonuria	Mousy or musty
Maple syrup urine disease	Maple syrup or burnt sugar

Investigation Findings
- Metabolic acidosis, lactic acidosis, Ketosis, Hypoglycemia
- Neutropenia found in
  - Methyl malonic acidemia
  - Propionic Acidemia
  - Isovaleric Acidemia

Approach to Organic acidemias



Case
- An Infant with seizures, poor feeding, skin rashes and Alopecia. On Investigation: Metabolic acidosis, ↑ blood ketones & normal NH3. Diagnosis?

Ans. Multiple carboxylase deficiency

MULTIPLE CARBOXYLASE DEFICIENCY
- Autosomal Recessive
- Tomcat urine odour
- Confirmed by Enzyme assay in lymphocytes
- **Treatment:** Biotin

MAPLE SYRUP URINE DISEASE (MSUD)

00:10:20

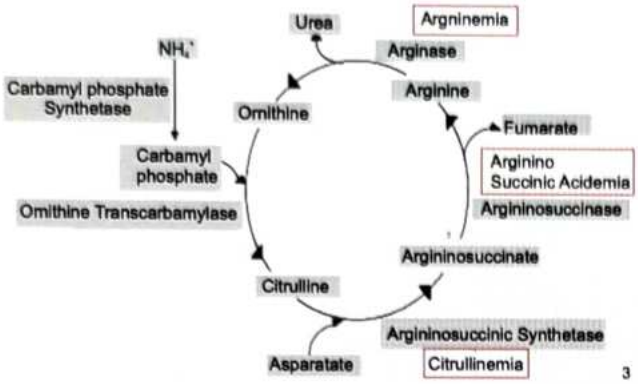
- Deficiency of Alpha keto acid dehydrogenase
- Accumulation of Branched chain amino acids Leucine, Isoleucine and Valine
- Sweet mousy odour of Maple syrup in body fluids

Diagnosis
- marked ↑ in leucine, Isoleucine, Valine in plasma & urine → by HPLC or Electrophoresis
- DNPH test (Dinitro phenyl hydrazine) → Yellow
- Ferric chloride test – Blue (FeCl3)

Screening Tests for IEM are
- Tandem mass spectrometry (TMS) → done on Dried Blood Spots
- Gas Chromatography Mass Spectroscopy (GCMS) → Done on Urine

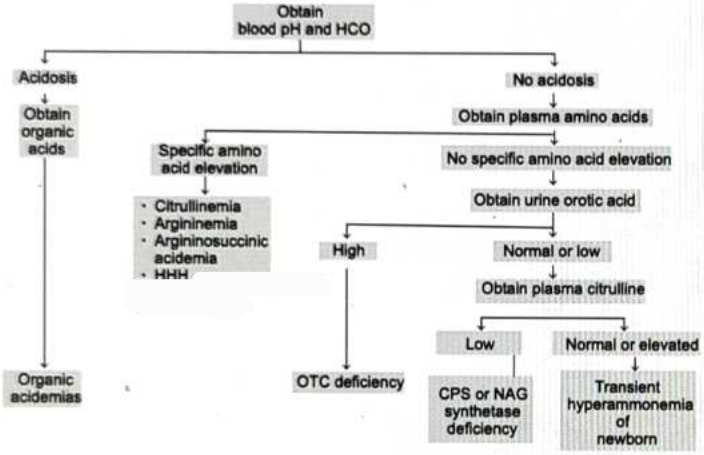
UREA CYCLE AND IT'S DEFECTS

00:15:04



3

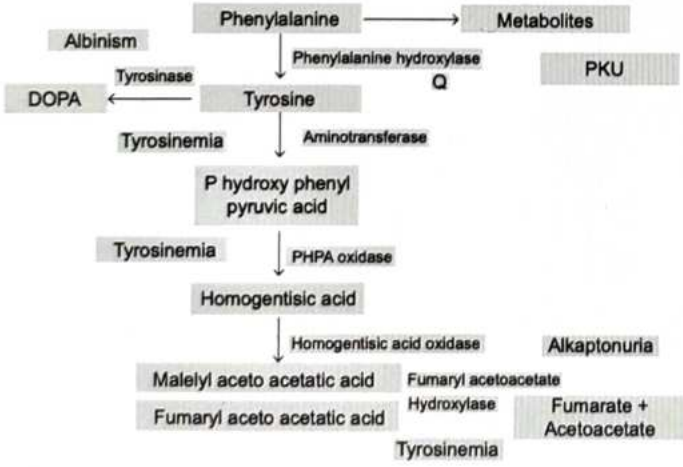
Approach to a child with elevated Ammonia



Treatment of Elevated Ammonia Levels

- Phenyl Acetate
- Arginine
- Hemodialysis
- Peritoneal dialysis

PHENYLALANINE METABOLISM AND ITS DEFECTS



PHENYLKETONURIA (PKU)

00:29:54

- Autosomal recessive disease due to deficiency of Phenylalanine Hydroxylase
- Phenylalanine metabolites like phenylacetate, Phenylpyruvate increase → Tyrosine becomes Essential amino acid

Clinical features of PKU

- Hypopigmentation: Fair skin, blonde hair, blue iris
- Musty / Mousy body odour
- Microcephaly
- Intellectual disability due to toxic levels of phenylalanine and insufficient tyrosine
- Growth retardation
- Dental enamel changes
- Neurological menifestations: Irritability, Tremors, Convulsions, Hypertonia

Important Information

Children born to mothers with PKU have

- **Microcephaly**
- **Congenital heart disease**
- **Growth retardation**
- **Mental retardation/ID**

Diagnosis

- FeCl3 test with urine: Green colour (Detects Phenylalanine in urine)
- Guthrie's test: Detects phenylalanine in serum
  - ↑ Levels of Phenylalanine and its Metabolites like Phenylacetate and Phenyl pyruvate

Previous Year's Questions

Q. A patient complaints of knee pain. Routine investigation are unremarkable and still, the patient is unsatisfied. Urine turns black on standing. What is the enzyme involved? (NEET Jan 2020)

A. Homogentisate oxidase
B. Xanthine oxidase
C. Methyl malonate oxidase
D. Phenyl pyruvate oxidase

Treatment

- Low Phenylalanine diet
- Adequate intake of Tyrosine should be ensured

ALKAPTONURIA

00:37:47

- Autosomal recessive disease due to deficiency of Homogentisic acid Oxidase

Clinical Features

- Ochronosis (Dark spot on Sclera / Ear cartilage)
- Arthritis
- Darkening of urine on standing (oxidation of Homogentisic Acid)
- Cardiac involvement (mitral / aortic valvulitis/ calcification)

TYROSINEMIA

00:39:15

Tyrosinemia Type I

- MC type of Tyrosinemia
- Deficiency of Fumaryl Acetoacetate Hydrolase (FAH)
- Severe disease of kidney, liver and peripheral nerves
- ↑ Serum AFP & Succinyl Acetone in serum & urine
- **Treatment**: Nitisinone (inhibits Tyrosine degradation at 4-HPPD)
- Case: Infant with hepatomegaly, bleeding manifestations (prolonged PT Despite vitamin K treatment) + elevated AFP/ succinylacetone level. Diagnosis?
  - Ans. Tyrosinemia

Tyrosinemia Type II

- Deficiency of Tyrosine aminotransferase
- Palmar / plantar hyperkeratosis
- Corneal ulcers & Intellectual disability seen

Tyrosinemia Type III

- Deficiency of 4 Hydroxy phenyl pyruvate deoxygenase (4 HPPD)

OTHER DISEASES

HARTNUP DISEASE

00:43:32

- Autosomal recessive
- Defect in SLC6A19 gene on chr 5p 15
- Defect in transport of mono-amino mono carboxylic amino acids by intestinal mucosa & renal tubules

Clinical Features

- Most children remain asymptomatic
- Cutaneous Photosensitivity & Pellagra like rash

On Investigation

- Amino aciduria restricted to neutral amino acids eg. Valine, Leucine, Phenylalanine, Tyrosine, Tryptophan

Rx

- Nicotinic acid or Nicotinamide
- High Protein diet

Previous Year's Questions

Q. False about hartnup's disease? (JIPMER May 2019)
A. Defect in neutral amino acid transport
B. Mental retardation is the common presentation
C. Most children are asymptomatic
D. Photosensitivity

HOMOCYSTINURIA

00:46:33

- Classical type is due to deficiency of Cystathionine β-synthase
- Can also be caused by
  - Defect in Methylcobalamin formation
  - Deficiency of MTHFR (Methylene Tetra Hydro Folate Reductase)
- **Clinical features**
  - Failure to thrive
  - Developmental delay
  - Intellectual Disability
  - Seizures
  - Behavioral disorders
  - Skeletal abnormalities resembling Marfan syndrome seen like tall stature, Arachnodactyly, Pectus excavatum, scoliosis, etc.
  - Ectopia lentis (subluxation of lens of eyes)
    → MSL (Marfan-Supero Lateral)
    → Homocystinuria (Infero Medial)

Complications

- Homocystinuria is a Procoagulant state
- Recurrent Stroke
- Spontaneous Pneumothorax
- Acute Pancreatitis

Diagnosis

- ↑ Methionine & Homocysteine in blood and body fluids
- Enzyme assay in liver biopsy /skin fibroblasts
- DNA analysis

Treatment

- High doses of vitamin B6(Pyridoxine) & folic acid
- Restriction of Methionine intake
- Cysteine supplementation

CLINICAL QUESTIONS

Q. A 2-month-old infant presented with hepatic crisis, peripheral neuropathy & Fanconi-like syndrome. Lab investigations showed elevated transaminase, low coagulation factors, and elevated succinylacetone in serum & urine. The most likely diagnosis?

A. Phenyl ketonuria
B. Homocystinuria
C. Tyrosinemia
D. Hawkinsinuria

Answer: C

Solution

- Tyrosine is derived from ingested proteins or is synthesized endogenously from phenylalanine.
- It is used for protein synthesis and is a precursor of dopamine, norepinephrine, epinephrine, melanin, and thyroxine.

Tyrosinemia type I or **Hereditary tyrosinemia** or **Hepatorenal tyrosinemia**

- Caused by a deficiency of the enzyme **fumarylacetoacetate hydrolase.**
- Hepatic disease, peripheral neuropathy and renal involvement are hallmark of disease.
- The presence of elevated levels of succinylacetone in serum and urine is diagnostic

Reference: Nelson 20 ed; p 641

Q. A 5-day-old child presents with intractable seizures. He had rashes all over his body. Blood examination showed hyperammonemia and lactic acidosis. The probable diagnosis is?

A. Organic acidemia
B. Mitochondrial encephalopathy with lactic aciduria
C. Phenylketonuria
D. Urea cycle enzyme deficiency

Answer: A

Solution

- Presence of hyperammonemia along with lactic acidosis in a child with neurological and cutaneous manifestations suggests a diagnosis of **Organic acidemia.**
- **C/F of Organic acidemia**: Lethargy, poor feeding, coma, vomiting, seizures, developmental delay, dystonia, specific odor
- **Investigation findings**: Metabolic acidosis, lactic acidosis, ketosis, Hyperammonemia, Hypoglycemia, Neutropenia.

Types of Organic Acidemia:

- Maple syrup urine disease

- Methylmalonic acidemia
- Propionic acidemia
- Multiple Carboxylase deficiency
- Glutaric acidemia
- Isovaleric acidemia

OTHER OPTIONS:

- Mitochondrial encephalopathy with lactic aciduria- stroke-like episodes
- Phenylketonuria- microcephaly, epilepsy, musty body odor, reduced skin/hair/eye pigmentation
- Urea cycle enzyme deficiency- poor feeding, seizures, no rash

Reference: Nelson's 20/e p 636-642

36 LYSOSOMAL STORAGE DISEASES

Refer Table 36.1

Important Information

Cherry red spot seen in
- GMI gangliosidosis
- Niemann pick disease
- Tay sachs disease

MUCOPOLYSACCHARIDOSES (MPS)

00:03:55

Type	Name	Enzyme Deficient	Clinical features
I	Hurler / Scheie disease	α - L - Iduronidase	• Coarse facies + corneal clouding + ID + hepatosplenomegaly + copious nasal discharge, airway problem + bony changes (dysostosis multiplex)
II	Hunter disease	Iduronate sulfate sulfatase	• Same as above but No Corneal Clouding
III	San fillipo disease	Heparan S sulfamidase	• Only Mental Retardation /ID
IV	Morquio disease	N acetyl galactosamine Sulfate sulfatase	• Bony abnormalities most severe
VI	Moroteaux Lamy ds	Aryl sulfatase B	• Same as Morquio + coarse facies + visceromegaly

Important Information

- All Mucopolysaccharidosis are Autosomal Recessive except Hunter disease (x linked inheritance)

Important Information

Dysostosis Multiplex
- Proximal Ends of Metacarpals are Bullet Shaped
- Anterior Beaking of Vertebral Bodies,
- J shaped sella

Anterior beaking of vertebral bodies

Coarse facies

Corneal Clouding

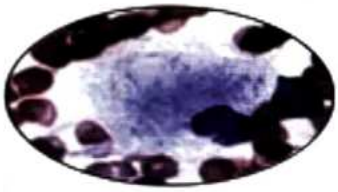
Proximal Ends of Metacarpals are Bullet Shaped

1. NIEMANN PICK DISEASE (NPD) 00:10:45

- Type A & B result from deficiency of acid sphingomyelinase, encoded by a gene on Chr 11 (Autosomal Recessive inheritance)
- **Type A**
  - Rapidly progressive neurodegenerative disorder
  - Hepatosplenomegaly
  - Lymphadenopathy
  - Death by 3 years
- **Type B**
  - Non-neuronopathic form
  - Seen in children & adults
  - Hepatosplenomegaly
  - Cherry Red spot +
  - Pulmonary involvement (diffuse reticular or finely nodular infiltration on CXR)
- **Type C**
  - Neuronopathic form that results from defective cholesterol transport
  - Often presents with prolonged Neonatal Jaundice

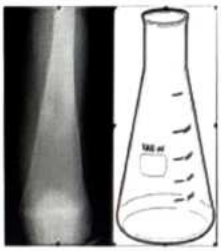
2. GAUCHER'S DISEASE 00:15:05

- Due to deficiency of glucocerebrosidase
- Accumulation of glucocerebrosides inside cells: Wrinkled paper/crumpled paper appearance of cytoplasm (Gaucher Cells)



Gaucher cell

- Clinical Features
  - Splenohepatomegaly
  - Bone pains/ pathologic fractures
  - Pancytopenia
    - → Anemia: easy fatigability
    - → Leucopenia: recurrent infections
    - → Thrombocytopenia: bleeding
  - Neurological features +/-
    - → I: no neurologic involvement
    - → II and III: neurologic involvement +

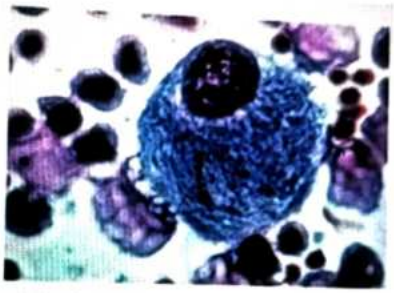


Erlenmeyer Flask Deformity

- Diagnosis
  - Deficiency of glucocerebrosidase in WBCs / fibroblasts
  - Gaucher cells in bone marrow (wrinkled paper appearance of cytoplasm)
  - X ray long bones: Erlenmeyer flask deformity
- Treatment
  - Enzyme Replacement Therapy

Previous Year's Questions

Q. A patient presented with anemia, bone pain hepato-splenomeglay. Biopsy of bone marrow is taken and the result shown here. What's the enzyme defect?



A. Glucose and Phosphatase
B. Glucocerebrosidase
C. Hexosaminidase A
D. Iduronidase sulphate sulphatase

Important Information

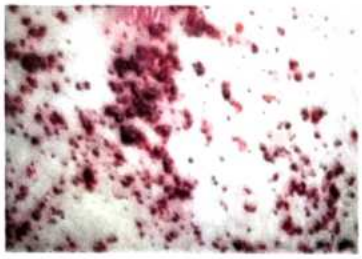
Metabolic Diseases for Which Enzyme Replacement Therapy (ERT) IS available 00:21:20

- **Gaucher disease**
- **Pompe disease (GSD type II)**
- **Hurler syndrome (MPS type I)**
- **Maroteaux lamy disease (Type VI MPS)**
- **Fabry disease**

3. FABRY DISEASE 00:22:20

- Deficiency of α galactosidase
- X – linked recessive
- Clinical features
  - Angiokeratomas are most dense between umbilicus & knees, in "Bathing Trunk Area"
  - Hyperhidrosis
  - Corneal and lenticular opacities
  - Acroparaesthesia
  - Pain is the most debilitating symptom

- Vascular diseases of kidney, Brain & Heart develop



- Hepatosplenomegaly
- Jaundice
- Vomiting
- Diarrhea

} even during infancy

- Plain X RAY abdomen: B/L adrenal gland calcifications

4. LESCH NYHAN SYNDROME

00:25:10

- Hypoxanthine guanine phosphoribosyl transferase (HGPRT) deficiency
- X linked recessive inheritance
- **Clinical features**
  - Asymptomatic at birth
  - Developmental delay
  - Neurologic signs including dystonia, dysarthria & spasticity
  - Self -injury (self-mutilation) is an important feature
- **Diagnosis**
  - Increased Serum uric acid levels
  - **Definitive Dx**: HGPRT enzyme assay
- **Treatment**
  - High fluid intake
  - Alkalization
  - Allopurinol

5. MENKE'S DISEASE

00:28:49

- Caused by mutation in a gene encoding copper (Cu) transporting ATPase (ATP 7A)
- Cu levels in liver and brain low but high in enterocytes and fibroblasts
- **Clinical features**
  - Progressive cerebral degeneration
  - Seizures
  - Feeding difficulties
  - Failure to thrive
  - Hypothermia
  - Apnea
  - Hypopigmentation
  - Abnormal kinky hair
- Hair changes seen on microscopy

1. Tricorhexis nodosa (break in hair shaft)
2. Pili torti (twisting of hair shaft)

- Classic form: death by 3 years of age

6. WOLMAN DISEASE

00:32:53

- Autosomal recessive inheritance
- LIPA gene (lysosomal acid lipase) mutation
- Accumulation of triglycerides and cholesterol esters in cells
- **Clinical features**

Table 36.1

Disease	Enzyme deficient	cherry red spot	Visceromegaly	Skeletal Involvement
Gaucher disease	Glucocerebrosidases	-	+	+
GM 1 gangliosidosis	β galactosidase	+	+	+
Neimann pick disease	Sphingomyelinase	+	+	-
Tay sachs disease	Hexosaminidase A	+	-	-

CLINICAL QUESTIONS

Q. A one-year-old boy presented with hepatosplenomegaly and delayed milestones. The liver biopsy and bone marrow biopsy revealed the presence of histiocytes with PAS-positive cytoplasm. Electron microscopic examination of these histiocytes is most likely to reveal the presence of?

A. Birbeck granules in the cytoplasm
B. Myelin figures in the cytoplasm
C. Parallel rays of tubular structures in lysosomes
D. Electron dense deposit in the mitochondria

Answer: C

Solution

Given scenario suggests Gaucher disease, in which glucocerebroside accumulation is seen in lysosomes.

Gaucher disease:

- Most common lysosomal storage disease
- AR disease
- Due to deficiency of glucocerebrosidase leading to accumulation of glucocerebroside inside cells
- C/F's: Hepatosplenomegaly, bone pains, pathologic fractures, bruising (thrombocytopenia), anemia
- Neurological features may or may not be present
- Erlenmeyer flask deformity on x-ray of long bone
- Gaucher cells in bone marrow (Gaucher cells are lipid laden macrophages that show a characteristic histologic appearance of "**wrinkled tissue paper**" of cytoplasm; The cytoplasm of the Gaucher cell reacts strongly positive with the periodic acid–Schiff (PAS) stain)

Birbeck granules in the cytoplasm- seen in histiocytosis X

Reference: Nelson's 20/e p 2484-2489, Ghai 9/e p 656

Q. In which of the following diseases, these X-ray findings are seen?

A. Gaucher disease
B. Fabry disease
C. Morquio disease
D. Niemann Pick disease

Answer: C

Solution

- The bony abnormalities seen in the X-ray- bullet-shaped metacarpals and beaked vertebral bodies comprise 'dysostosis multiplex', seen in Mucopolysaccharidosis (MPS)- Morquio disease or type IV MPS.
- Gaucher disease - X-ray of long bones- Erlenmeyer flask deformity

Reference: Ghai 9th ed/p- 657

LEARNING OBJECTIVES

UNIT 10: DISEASES OF IMMUNE SYSTEM

- Primary immunodeficiency
  - Primary antibody deficiency
  - Cellular & combined immunodeficiency
  - Phagocytic cell disorders

- Vasculitic disorders
  - Classification
  - HSP
  - Kawasaki disease

37 PRIMARY IMMUNODEFICIENCY

Definition: A group of disorders characterized by impaired ability to produce a normal immune response

When to suspect
- Infections occurring at
  - Unusual sites e.g. liver, brain
  - Unusual pathogens e.g. Pneumocystis jiroveci, Burkholderia
  - Unusual severity

Types 00:02:33
1. Primary antibody deficiency
2. Cellular and combined immunodeficiency
3. Phagocytic cell disorders

1. PRIMARY ANTIBODY DEFECTS 00:02:43

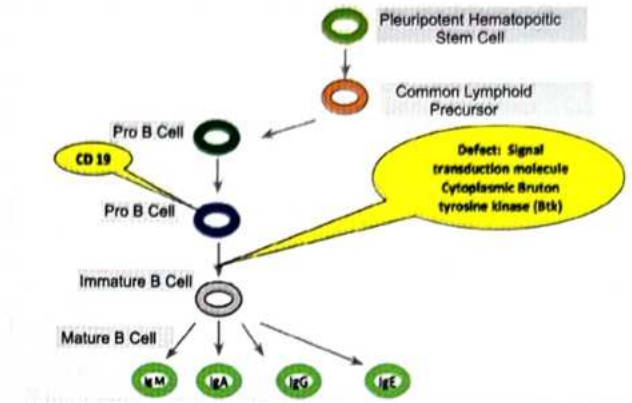
- Bruton's X linked agammaglobulinemia
- Common variable immunodeficiency (CVID)
- Selective IgA deficiency
- Hyper IgM syndrome
- IgG subclass deficiency

BRUTON'S DISEASE / X LINKED AGAMMAGLOBULINEMIA (XLA) 00:04:25

Defect
- BTK gene on Chr Xq 21.22 mutation (BTK protein Tyrosine kinase is needed to transduce signal from Ig receptor complex of pre B Cell)
  ↓
  Pre B-Cells cannot deliver signals
  ↓
  Maturation stops at this stage

Clinical Features
- Usually present at 6-18months of age
- More common in males
- Tonsils & adenoids absent
- Lymph nodes not palpable

Diagnosis
- Decreased B cells, T cells are normal
- Plasma cells absent
- Low Ig levels
- Germinal centers of LN underdeveloped



CVID (COMMON VARIABLE IMMUNE DEFICIENCY) 00:08:04

- **Defect:** Inability of B cells to differentiate into plasma cells due to defect in-
  - BAFF (B cells Activation Factor for TNF-R)
    → BAFF helps in survival & differentiation of B cells
  - ICOS (Inducible co-stimulator)
    → Helps in T cell activation & interaction of T & B cells
- **Diagnosis**
  - Hypogammaglobulinemia with normal B cells
  - Lymph Node may be normal or enlarged
- **Complications**
  - Increased risk of B cell lymphomas, autoimmune diseases

SELECTIVE IGA DEFICIENCY 00:11:22

- Most common type of immune deficiency- Selective IgA deficiency
- **Defect**: Impaired differentiation of naive B cells into IgA producing plasma cells.
- **Clinical features**: Increased sinopulmonary infections.
- **Diagnosis:** Decreased IgA levels
- **Complications:** Increased risk of malignancy & autoimmune diseases.

Previous Year's Questions

Q. All of the following are true for selective IgA deficiency EXCEPT? (JIPMER Dec 2019)

A. Can occur due to phenytoin administration
B. Intestinal giardiasis is rare
C. IgG2 subclass deficiency
D. Antibodies to IgA may occur

HYPER IGM SYNDROME

00:13:25

- Inability of B cells to class switch to IgG, IgA & IgE antibodies
- Can be AR or X Linked recessive
- Loss of function of CD40 on B cells
- Due to Loss of AID (Activation Induced Cytidine Deaminase) required for class switching

- **Diagnosis**
  - Low IgG, IgA and IgE
  - High IgM

IgG SUBCLASS DEFICIENCY

00:15:45

- Normal total serum IgG but decreased levels of 1 of the subclasses
- Most common subtypes in children is IgG_2 deficiency while in adults in IgG3deficiency

2. CELLULAR & COMBINED IMMUNODEFICIENCY DEFECT

00:16:42

- SCID
- Hyper IgE syndrome
- Wiskott Aldrich syndrome
- Ataxia telangiectasia
- Di George syndrome

SEVERE COMBINED IMMUNODEFICIENCY

00:17:31

- **Defect**
  - **X linked:** Cytokine receptor gamma chain defect
    - → IL7 defect: T cell affected
    - → IL15 defect: NK cell affected
  - **Autosomal Recessive**
    - → ADA deficiency: Loss of common lymphoid precursors of B & T cells due to accumulation of deoxyadenosine-toxic to immature lymphocytes
    - → JAK- 3 defect
    - → IL- 7 receptor defect
- **Clinical features**
  - Presents in 1st few months of life
  - Recurrent/ persistent diarrhea, pneumonia, otitis media, sepsis.
  - Persistent mucocutaneous candidiasis
  - Live vaccine organism (BCG, OPV, Rota) can cause severe/ fatal infections
- **Diagnosis**
  - Absolute lymphocyte count< 2500/mm^3
  - T cells make up < 20%of total lymphocytes
  - ↓ Antibody levels
  - Lymph node: Depleted T&B cells zones
  - Thymus: small, devoid of lymphoid cells
- **Confirmation:** Identification of specific gene defect
- **Treatment**
  - HSCT
  - Gene therapy
  - PEG-ADA for ADA deficient SCID

HYPER IgE SYNDROME (JOB SYNDROME)

00:23:44

- Mutation in stat 3 gene: IL-17 deficiency
- AD inheritance
- **Clinical Features**
  - Characteristic facies:
    - → Coarse face
    - → Prominent forehead
    - → Deep set eyes
    - → Broad nasal bridge
    - → Fleshy nasal tip
    - → Hemihypertrophy
  - Recurrent abscesses: Skin/ lungs
    - → Most common: Staph aureus > Candida albicans

- **Diagnosis**
  - IgE > 2000IU/ml (IgG, A, M- normal/ IgD may be increased)
  - Blood & sputum eosinophilia

WISKOTT ALDRICH SYNDROME

00:26:50

- X linked
- Defect in WASP gene (Chromosome X p II)

↓

Links membrane receptor to cytoskeletal proteins

↓

Defect leads to defective cell migration & signal transduction

- **Clinical Features**
  - Eczema
  - Recurrent infections
  - Thrombocytopenia with small platelets

  } Triad
- **Diagnosis**
  - Platelets: Small & decreased in number
  - IgM: Low
  - IgE& IgA: ElevAted

ATAXIA TELANGIECTASIA

00:29:42

- Due to defect in ATM gene (chromosome 11q), which is a sensor of DNA damage

  ↓

  Defective DNA repair & abnormal V, D, J recombination

  ↓

  Abnormal iso type switching & Increased cancer risk

- **Clinical features**
  - Ataxia
  - Oculocutaneous telangiectasia
  - Immunodeficiency: Recurrent infections
  - Increased sensitivity to ionizing radiation & defect. DNA repair
  - Increased risk of lymphocytic malignancies & adenocarcinoma
- **Diagnosis**
  - Low IgA, IgE and IgG2 levels

DIGEORGE SYNDROME (VELO CARDIOFACIAL SYNDROME)

00:33:24

- Chromosome 22q11 microdeletion → Failure of development of 3rd & 4th pharyngeal pouches.

  ↓

  a. Hypoplasia of Thymus: Decreased T cells.
  b. Parathyroid Hypoplasia: Hypocalcemia
  c. Ultimo-brachial body: Defect in heart & great vessels

'CATCH – 22 --- 22q11 deletion

- **C - Cardiac Anomaly**
- **A - Abnormal face (Hypertelorism, antimongoloid slant, Short philtrum, mandibular hypoplasia)**
- **T- Thymic hypoplasia**
- **C- Cleft palate**
- **H- Hypocalcemia**
- **Diagnosis**
  - CXR: Absent thymic shadow
  - Blood: Decreased CD 3 T Cells, increased B cells, decreased IgA, IgE↑
  - Lymph node: Para cortical area depletion

3. PHAGOCYTE DYSFUNCTION

00:38:01

- Chronic Granulomatous Disease (CGD)
- Leukocyte Adhesion Defect (LAD)
- Chediak Higashi Syndrome

CHRONIC GRANULOMATOUS DISEASE (CGD)

00:38:13

- X linked or AR
- Mutation in genes involving NADPH oxidase
- **Clinical features**
  - Recurrent infections with catalase positive organisms like staph aureus, Serratia marcescens.
  - Granuloma Formation is a hallmark

    → Can cause pyloric outlet or bladder outlet or ureteric obstruction.

    → Intestinal granulomas resembles Crohns Disease
- **Diagnosis**
  - NBT (Nitro blue Tetrazolium Test)
  - Flow cytometry using Dihydrorhodamine: Definitive test

LEUKOCYTE ADHESION DEFICIENCY (LAD)

00:41:32

Disease	Deficiency	Defect
LAD I	• Beta 2 integrin family is deficient or defective	• Integrins: Adhesion of leukocytes to endothelium (CD 11) and β (CD1B) chain
LAD II	• Fucosylated carbohydrate ligands for selectins [sialyl lewis x] are absent	• Selectins: Cellular margination and rolling

- **Clinical features**
  - Delayed fall of umbilical cord stump
  - Signs of inflammation are absent
  - Pus does not form
- **Investigations**
  - Neutrophilic leukocytosis (TLC>25000/mm^3)
  - LAD1: Absence of CD11& CD 18 by flow cytometry
  - LAD2: Lack of Sialyl Lewis X

Previous Year's Questions

Q. Which of the following primary immunodeficiency present during the neonatal period?
(JIPMER Dec 2019)

A. Hyper IgE syndrome
B. Chronic granulomatous Disease
C. Leukocyte adhesion defect
D. Ataxia telangiectasia

CHEDIAK HIGASHI SYNDROME

00:45:28

- AR, Mutation of LYST gene on chromosome 1q (regulates vesicle transport)
  ↓
  Uncontrolled fusion of Lysosomes with each other
  ↓
  Giant Granules
- Melanosomes are oversized
  Delivery to keratinocytes & hair follicles is compromised
  ↓
  Hypopigmented hairs

- Clinical features
  - light skin & Silvery hair
  - Frequent infections
  - Neuropathy, ataxia
  - Impaired platelet aggregation
    → Due to deficiency of dense granules containing ADP and serotonin
    → Prolonged BT with normal Platelet count but platelet function is affected.
- Investigation
  - Progressive neutropenia & abnormal platelets, neutrophils & NK cells function.
  - Large inclusions in all nucleated cells (with wright/peroxidase stains) in peripheral smear & BM
- Treatment
  - High doses of vitamin C
  - HSCT (hematopoietic stem cell transplant)
- Complication
  - HLH (Hemophagocytic Lympho-histiocytosis)

CLINICAL QUESTIONS

Q. Children with Chediak Higashi syndrome have light skin, silvery hair, solar sensitivity, photophobia, frequent infections, neuropathy, prolonged bleeding times with normal platelet count. What is the treatment which improves the clinical status of some children in the stable phase?

A. Vitamin B12
B. Vitamin B1
C. Vitamin C
D. Vitamin E

Answer: C

Solution

- **High-dose ascorbic acid or Vitamin C** (200 mg/day for infants, 2,000 mg/day for adults) may improve clinical status of some children in stable phase of Chediak Higashi disease

Reference: Nelson's 20/e p 1045

Q. A 3-year-old child presents with recurrent pneumonia, eczema & thrombocytopenia. Which protein synthesis is abnormal in this child?

A. Wasp
B. Hamartin
C. Adenosine deaminase
D. HLA 1a

Answer: A

Solution

Recurrent infections, eczema & thrombocytopenia in a child- Wiskott Aldrich syndrome

- X-linked recessive syndrome,
- WASP gene- defective
- **Wiskott-Aldrich syndrome:**
  - There is a progressive loss **of T-lymphocytes in the**peripheral blood and in the T-cell zones (paracortical areas) of the lymph nodes, with variable defects in cellular immunity.
  - Patients **do not make antibodies to polysaccharide antigens**, and the response to protein antigens is poor.
  - **IgM levels in the serum are low**, but levels of IgG are usually normal. Paradoxically the levels of IgA **and IgE are often elevated**.
  - R,:- Allogeneic hematopoietic stem cell transplant

Reference:

Nelson's Textbook of Paediatrics 20th edition Pg. 1027
OP Ghai Textbook of Paediatrics 9th edition Pg- 179

38 VASCULITIC DISORDERS IN CHILDREN

CLASSIFICATION

00:00:36

A. Large Vessel Vasculitis

- Giant cell arteritis
- Takayasu arteritis

B. Medium Vessel Vasculitis

- Anti-endothelial cell antibody mediated- Kawasaki disease
- Immune complex mediated-Polyarteritis nodosa.

C. Small Vessel Vasculitis

Immune complex mediated	Pauci immune
• HSP	• Microscopic Polyangiitis
• SLE	• Wegner Granulomatosis
• Good pasture disease	• Churg Strauss Syndrome

HENOCH SCHOENLEIN PURPURA (HSP)

00:03:29

- Palpable purpura with presence of 1 or more of
  - Diffuse abdominal pain
  - Arthritis or arthralgia
  - Any biopsy showing IgA deposition
    → Renal Involvement: Glomerulonephritis is seen in 1/3 of patients
  - Thrombocytopenia Absent

coronary artery aneurysm

KAWASAKI DISEASE

00:06:05

- Diagnostic Criteria
  - Fever for > 5 days with any 4 out of 5- "C R E A M" features
  - **C** - B/L non-purulent Conjunctivitis
  - **R** - Rash involving trunk
  - **E** - Erythema & Edema of palms & soles along with desquamation
  - **A** - Adenopathy
  - **M** - Mucosal involvement (Strawberry Tongue)

How to remember

- CREAM

- No diagnostic test
- Leukocytosis, thrombocytosis, increased ESR or CRP
- Coronary artery aneurysm (Giant > 8mm in diameter) is an important complication but the incidence has decreased due to early diagnosis and treatment.

Important Information

- **Scarlet fever is a close D/D of Kawasaki disease**

Treatment

- Iv Ig: as soon as diagnosis is made to prevent complications.
- Aspirin: High dose f/b low dose.
- Steroids if persistent fever despite Ivlg.

CLINICAL QUESTIONS

Q. 10 years old female child presents with oral aphthous stomatitis associated with redness & periorbital pain in both eyes. On further examination, the patient present with genital ulceration. The patient's family has an occupational history of working in a silk factory. Which of the following is the most probable diagnosis?

A. Behcet's syndrome
B. Giant cell arteritis
C. Henoch-Schonlein purpura
D. Wegener's granulomatosis

Answer: A

Solution

Behçet disease: high prevalence in countries along the Silk Road, extending from Japan to the eastern Mediterranean

- characterized by recurrent oral ulcerations, genital ulceration, uveitis & skin abnormalities

Reference: Nelson's 20/e p 1190-1191, Ghai 9/e p 630

Q. 13-year-old female child presented with recurrent sinusitis, fever, arthralgia, respiratory distress, hematuria, and hypertension. Renal biopsy showed necrotizing granuloma. The anti-proteinase-3 ANCA was positive. The most likely diagnosis is?

A. Polyarteritis Nodosa
B. Wegener's granulomatosis
C. Microscopic polyangiitis
D. Churg-Strauss syndrome

Answer: B

Solution

- Respiratory & Renal involvement along with positive c-ANCA (Anti Proteinase-3) indicates Wegener's Granulomatosis

Reference: Nelson's 20/e p 1221-1223, Ghai 9/e p 630

LEARNING OBJECTIVES

UNIT 11 INFECTIOUS DISEASES

- Imp. Viral diseases
  - Rubella
  - Measles
  - Chicken pox
  - Erythema infectiosum
  - Hand foot mouth disease
  - Roseola infantum
  - Mumps, polio
  - HIV
  - H1N1

- Covid 19
  - Imp aspects of covid in children

- Imp. Bacterial diseases
  - TB
  - Diphtheria
  - Pertussis
  - Tetanus
  - Scarlet fever

- Congenital infections
  - Congenital toxoplasmosis
  - Congenital TB, syphilis, rubella
  - Congenital CMV, varicella

39 IMPORTANT VIRAL DISEASES IN CHILDREN

RUBELLA (GERMAN MEASLES OR 3-DAY MEASLES)

00:00:42

- Mild, exanthematous disease
- Rubella Virus (SS RNA virus): Family Togaviridae
- Incubation period (IP): 14-21 Days
- Communicable 5 days before to 6 days after rash

Clinical features

- Prodrome: low-grade fever, sore throat, malaise, headache
- Rash begins on face & spreads Centrifugally
- Forchheimer spots on soft palate may be present.
- Posterior auricular lymphadenopathy.

MEASLES

00:03:05

- RNA Virus; Family: Paramyxoviridae
- Incubation period: 8 -12 Days
- Communicable 3 days before to 4-6 days after onset of rash
- Receptors for measles virus: CD 150 & PVRL 4
- Fusion of infected cells: Multinucleated Warthin Finkeldey Giant Cells (pathognomonic for measles)

Clinical features

- Prodromal phase: Fever, conjunctivitis, Coryza
- Koplik Spots on inner cheeks, vaginal mucosa, conjunctiva
- Rash begins behind the ears & spreads downwards to rest of body.
- Rash fades in 7 days in the same progression as it evolved, leaving behind pigmentation at its site.

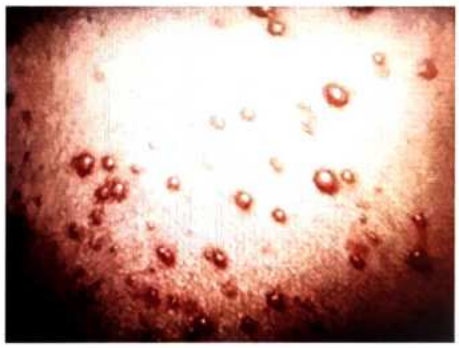
Important Information

1. MC complication is otitis media
2. MC cause of death: pneumonia
3. Sub-Acute Sclerosing Panencephalitis (SSPE)
   - Rare fatal, severe, long-standing complication of Measles
   - Develops 7-13 years after primary measles infection
   - Myoclonus, choreoathetosis, dystonia, rigidity.

CHICKEN POX (VARICELLA)

00:09:29

- Varicella Zoster virus, DNA Virus, herpes family
- IP: 10-21 days



Clinical Features

- Pleomorphic Rash appears 24-48 hrs after prodromal symptoms
- Simultaneous presence of various types of skin lesions e.g., papules, vesicles, pustules- pleomorphic rash is the characteristic.
- A child with varicella remains infective till all vesicles are crusted.

Complications

- Secondary bacterial infections of the skin lesions
- Purpura fulminans
- Meningoencephalitis
- Ataxia
- Transverse myelitis
- Optic neuritis
- Stroke
- Reyes Syndrome

ERYTHREMA INFECTIOSUM

00:13:00

- Caused by - Parvovirus B 19
- Incubation period - 4 - 28 days
- Prodromal phase - Low grade fever, headache & URTI
- Hallmark - Slapped cheek appearance of rash

Important Information

Diseases Caused By Parvo Virus
- Erythema infectiosum
- Transient aplastic crisis
- Papular purpuric "gloves and socks" syndrome

HAND FOOT MOUTH DISEASE

00:14:56

- MC Cause: Coxsackie A16
- Blisters in oral cavity.
- Palmar and plantar pustules
- Mild self-limiting illness.
- Resolves in 5-7 days

ROSEOLA INFANTUM

00:15:56

- Caused by HHV6A & 6B.
- Nagayama spots are seen.
- The rash appears when the fever subsides.

MUMPS

00:16:42

- Acute U/L or B/L parotid swelling with fever
- Orchitis common in adolescent males
- MC complication is Aseptic meningitis.

POLIOMYELITIS

00:17:45

- RNA virus of Picornaviridae family
- 3 biogenetically distinct serotypes: Types 1, 2, 3
- Spreads from GIT to CNS: Aseptic meningitis & poliomyelitis
- 90-95% infectious are inapparent: Protective immunity
- Non-paralytic influenza (flu) like illness in 5% of infections
- Paralytic polio occurs in 1 in 1000 infections in infants to 1 in 100 infections in adolescents (very rare)

HIV IN CHILDREN

00:19:50

- Perinatal Treatment has decreased the Fetal infection rate to <2%
- Caesarean Section is no longer recommended for Prevention of parent to child transmission (PPTCT) & is to be done only if there is an obstetric indication.

- **Diagnosis of HIV in Infants & Children**
  - Preferred tests in infants/neonates
    → HIV RNA PCR
    → HIV DNA PCR
    → HIV Culture
  - In breast fed infants, re-testing should be done 12 weeks after cessation of breast feeding.
  - In children > 18 months, IgG antibody demonstrated by ELISA or Western Blot

- **Prophylaxis for Infant Born to Mother With HIV**
  - Nevirapine +/- zidovudine for atleast 6 weeks (12 weeks for breast fed babies)
  - If replacement feeding is readily available & safe, breast feeding is avoided.
  - In low resource settings, exclusive breastfeeding is recommended since its benefits outweigh the risks.

Treatment of HIV In Children
- ART (Anti-retroviral treatment) should be initiated in all children living with HIV, regardless of WHO clinical stage or CD 4 count
- High priority groups:
  - < 2 yrs age
  - Who clinical stage 3 or 4
  - < 5 yrs with CD_4 count < 750 / mm^3 or < 25%

Preferred First Line Treatment Regimen

Age group	ART regimen
Infant < 2 weeks	Zidovudine + Lamivudine + Nevirapine
Children < 3 yrs	Abacavir (or Zidovudine) + Lamivudine + Lopinavir / Ritonavir
Children 3-10 yrs	Abacavir + Lamivudine + Efavirenz
Adolescents	Tenofovir + Lamivudine + Efavirenz

Important Information

- Cotrimoxazole prophylaxis should also be given for PCP infection.

H1N1 INFECTION

- DOC: Oseltamivir
- Dose in infants: 3 mg/kg/dose
  - < 15 kg: 30 mg
  - 15-23 kg: 45 mg
  - 24-40 kg: 60 mg
  - >40 kg: 75 mg
- Oseltamivir is given twice daily for 5 days.

CLINICAL QUESTIONS

Q. A 5-year-old child develops a fever with rash on the first day of fever. Rash disappears after few days & the child develops ataxia. Most probable diagnosis is?

A. Measles
B. Fifth disease
C. Chicken pox
D. Rocky mountain spotted fever

Answer: C

Solution

- Rash appearing on 1st day of fever suggests Chickenpox
- Ataxia can occur as a complication of varicella infection.

Reference: Nelson's 20/e p 1579-1585, Ghai 9/e p 210-211

Q. A child presents with a history of high fever for 4 days along with seizures. A rash develops on the trunk on the day after the fever subsides. What is the most probable diagnosis?

A. Roseola infantum
B. Measles
C. Rubella
D. Varicella

Answer: A

Solution

History of high fever & rash appearing as the fever subsides is suggestive of **Roseola infantum.**

Roseola infantum/sixth disease/exanthema subitum

- Caused by herpes virus (HHV6A and 6B)
- **Clinical features:**
  - Sudden onset of high fever
  - Rash appear when the fever subsides
  - **Nagayama spots** are seen
- Lab findings in **Roseola infantum**
  - Relative Lymphocytosis
  - Leukopenia

Reference: Nelson Textbook of Pediatrics 20th Edition Page no:1594-1597

40 COVID-19 IN CHILDREN

Caused by 00:00:36

- SARS-CoV2 (Severe Acute Resp. syndrome - corona virus 2): Possibly originated in bats
- Pandemic began in Wuhan, China in Dec 2019

Modes of Transmission 00:02:06

- Direct inhalation of infected droplets produced during coughing/ sneezing by an infected person.
- Contact with surface and fomites, soiled by infected respiratory secretions.

Incubation Period

- 2-14 days (Median IP: 5 days)

Clinical features 00:03:59

- Similar to any acute resp. viral infection
- Fever, cough, breathlessness, sore throat, fatigue, malaise.
- Nasal symptoms (e.g. coryza) are less common.
- Children usually have milder symptoms as compared to adults who get infected
- Infants & younger children → more chances of severe manifestations
- Those with severe ds → usually develop complication like hypoxemia or hypoperfusion by the end of first week
- Possible acute complications in children
  - ARDS
  - Myocarditis
  - Septic shock
  - DIC
  - AKI
  - Liver dysfunction

PIMS-TS 00:08:10

a. Paediatric inflammatory multisystem syndrome, temporally associated with SARS-Cov-2

b. It is a hyper inflammatory syndrome seen in some children (Due to immune injury mediated by antibody dependent enhancement response.)

c. **Clinical features**

- Persistent fever
- Evidence of inflammation
- Mucocutaneous changes (rash, conjunctivitis, periorbital edema)
- Single/ Multi-organ dysfunction in the absence of any other known infections.
- May deteriorate rapidly & child may need intensive care support
- May have RT PCR negative but Ab positive

Whom to suspect for infection with SARS CoV_2? 00:13:32

- In all hospitalized children with acute respiratory illness (Fever & cough and or shortness of breath)

or

- Asymptomatic, direct contacts of lab confirmed case

Lab diagnosis 00:14:56

- Preferred sample
  - In Non-intubated children: Upper resp. tract sample (nasopharyngeal & Oropharyngeal swabs) – transported in VTM (Viral Transport Media) on ice
  - in Intubated patient: Bronchoalveolar Lavage or endotracheal aspirate preferred.
- Preferred diagnostic test: RT-PCR (Reverse Transcriptase Polymerase chain reaction)

Treatment 00:18:10

a. **Mild illness** (No resp. difficulty, feeding well and SpO_2 > 92%)
Home based supportive care

- Fever control using PCM
- Ensure adequate hydration
- Explain danger signs
- Duration of isolation recommended: 14 days from symptoms onset or afebrile for 72

b. **Moderate** – sever illness: Hospitalization

Indications of hospitalization

i. Resp. distress
ii. SpO_2 < 92% on room air
iii. Shock/ poor peripheral perfusion
iv. Poor oral intake
v. Lethargy in neonates and infants
vi. Seizures/ encephalopathy

Management in hospital

i. IV fluids
ii. Symptomatic Rx
iii. Antimicrobials in suspected septic shock
iv. Respiratory support

- O_2
- HFNC (High Flow Nasal cannula)
- Mechanical ventilation (intubation using video Laryngoscope)

v. Hydroxychloroquine (In moderately severe cases)
vi. Remdesivir
vii. Tocilizumab (anti-IL6)
viii. For PIMS-TS
- IVIg
- Steroids
- Immunomodulators.

CLINICAL QUESTIONS

Q. Which of the following is true regarding Pediatric Inflammatory Multisystem Syndrome?

A. It is a hyperinflammatory syndrome
B. It is not associated with SARS-COV 2 C
C. It is IgE mediated
D. RT-PCR is positive

Answer: A

Solution

- PIMS - Pediatric Inflammatory Multisystem Syndrome
  - Temporally associated with SARS – Cov-2 - It is a hyperinflammatory syndrome seen in some children
  - ↓ Due to immune injury mediated by antibody-dependent enhancement response.
  - C/F -
    - → Persistent fever
    - → Evidence of inflammation
    - → Mucocutaneous changes (rash, conjunction edema)
    - → Single/ multi-organ dysfunction in the absence of any other known infections
    - → May deteriorate rapidly & child may need intensive care support
    - → May have RT PCR negative but Ab positive

Reference: https://www.childrens.com/health-wellness/

Q. Which of the following is not considered as the indication for hospitalization in moderate to severe cases of COVID-19?

A. Respiratory distress
B. Poor oral intake
C. Lethargy in neonates & infants
D. Diarrhea and reduced CRT

Ans:

Solution

- Moderate- severe illness - Hospitalization (Indications)
  - Respiratory distress - SpO2 <92% on room air
  - Shock/ poor peripheral perfusion
  - Poor oral intake
  - Lethargy in neonates & infants
  - Seizures/ encephalopathy

Reference: https://www.cdc.gov/coronavirus/2019-ncov/hcp/clinical-guidance-management-patient

41 IMPORTANT BACTERIAL DISEASES IN CHILDREN

TB IN CHILDREN

00:00:24

- MC age group in children: < 5 yrs
- MC form of TB in children: Pulmonary TB
- MC extrapulmonary form of TB in children: Tubercular lymphadenitis
- Primary TB: Ghon's focus seen in lungs
- Diagnosis
  - History of contact with TB patient
  - Clinical features: Low grade fever, constitutional symptoms, area specific features
  - Demonstrate bacteriological evidence for TB from sputum/ gastric aspirate/ BAL
    - → CBNAAT (cartridge based nucleic acid amplification test)
    - → Microscopy
  - A positive tuberculin skin test / Mantoux test is defined as an induration > 10 mm, measured 48-72 hrs after intradermal injection with tuberculin 2 TU
    - → No role in Dx
  - Serological tests (IgM, IgG, IgA against MTB antigens)

Important Information

- **BCG test and IGRAs have no role in diagnosis of TB**

- Recent updates in treatment of TB in children

First line regimen

Type of TB case	Treatment regimen in IP	Treatment regimen in CP
New	(2) HRZE	(4) HRE
Previously treated	(2) HRZE	(4) HRE

- Treatment is same for both.
- Only pyrazinamide is stopped in CP.
- Daily treatment is given for all pediatric patients.
- Drug sensitivity testing for atleast rifampicin should be conducted in previously treated patients.
- Don't wait for DST results to start the treatment.
- Daily Doses of
  - → Rifampicin: 15 mg/kg (max 600 mg/day)
  - → Isoniazid: 10 mg/kg (max 300 mg/day)
  - → Ethambutol: 20 mg/kg (max 1500 mg/day)
  - → Pyrazinamide: 30-35 mg/kg (max 2000 mg/day
- Steroids are added in severe cases.
  - → Prednisolone 1mg/Kg/Day, Tapered Over 6-8 wks
  - → Indications
    - Tuberculous meningitis
    - Pericarditis & pericardial effusion
    - Massive Pleural Effusion
- INH prophylaxis is recommended for children less than 5 years of age who have H/o contact with active TB patient after ruling out disease in them.

DIPHTHERIA

00:11:50

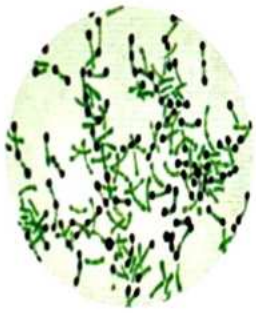
- Acute toxic infection caused by Corynebacterium diphtheriae
- Incubation period: 2-4 Days
- Clinical features
  - Universal early symptom: Sore throat
  - Fever (only in 50%), malaise, headache
  - Dysphagia, hoarseness
  - Stridor & croupy cough
- O/E: A dense necrotic coagulum of organisms, epithelial cells, fibrin, WBCs & RBCs forms and advances to become a gray-brown, leather like adherent pseudomembrane.
- Pseudo membrane can extend to uvula, soft palate,

posterior oropharynx or glottic areas

- Effects of diptheritic toxin

1. Local effects
   - Paralysis of palate & hypopharynx
2. Systemic effects
   - ATN
   - Cardiac involvement
   - Thrombocytopenia
   - Demyelination of nerves

- Diagnosis
  - Sample: A portion of membrane along with underlying exudate
  - Stained using Albert stain or specific fluorescent antibody
  - Culture & antimicrobial susceptibility tests



- Treatment
  - Specific antitoxin (as soon as possible) is the mainstay of therapy
  - Antibiotic therapy is not a substitute for antitoxin (penicillin/ erythromycin/ clindamycin/ rifampicin/ tetracycline

  → To Halt toxin production
  → To Treat localized infection
  → Prevents transmission
- Management of Contacts of a Child with Diptheria

A. Isolation and monitoring
   - All the household contacts and persons who had intimate respiratory or physical contact with patient, should be closely monitored for the illness for atleast 7 days.
   - Cultures from any lesions appearing on nose, throat or skin should be sent for diagnosis.

B. Chemoprophylaxis
   - Should be given regardless of the immunization status of contacts.
   - Single dose of inj. Benzathine penicillin G (6 lakh units IM for < 6 years age and 12 lakh units IM for > 6 years age)
   - Erythromycin (40-50mg/kg/day) in 4 divided doses for 10 days is an alternate.
   - Azithromycin is an another alternate.

C. Vaccination
   - Given to immunized individuals who have not received a booster dose in last 5 years.
   - Children who have not received their 4th dose of diphtheria containing vaccine should be vaccinated.
   - Those who have received < 3 doses of diphtheria toxoid or have uncertain immunization status are immunized with age appropriate diphtheria containing vaccine.

Important Information

- **< 7 years : DPT**
- **> 7 years: Tdap**

- Complications of Diphtheria

Cardiac	Neurological

• Toxic cardiomyopathy
  ○ Seen in 10-25% patients.
  ○ Causes =/> 50% deaths.
  ○ 1st evidence: disproportionate tachycardia to degree of fever
  ○ Prolonged PR interval and ST-T changes
	• Paralysis of soft palate (in 2- 3 weeks of Onset of illness)
	• Weakness of posterior pharyngeal, laryngeal and facial nerves (nasal intonation of voice)
	• Oculomotor and ciliary paralysis (in 5 weeks of illness)
	• Symmetric polyneuropathy (within 10 days- 3 months of illness)
	  ○ Distal weakness and Decreased DTRs.

PERTUSSIS

00:31:48

- Caused by Bordetella pertussis or B. Parapertussis
- 3 Stages
  - Catarrhal stage (1-2 wk): Rhinorrhea, lacrimation.
  - Paroxysmal stage (2-6 wk): Dry, uninterrupted

paroxysmal, hacking cough with inspiratory whoop.
  - Convalescent stage (>6 wk): The number, severity, and duration of episodes diminish.
- Attack rate is as high as 100% in susceptible individuals
- Investigations
  - Leukocytosis (15000-100000 / ML) (absolute lymphocytosis)
  - Confirmation by culture/PCR/serology.
- Treatment
  - Macrolides (Azithromycin/erythromycin)
- Complications
  - Apnea
  - Otitis media
  - Pneumonia
  - Sequelae of forceful coughing

TETANUS

00:35:38

- An acute, spastic paralysis, caused by neurotoxin of clostridium tetani. (a motile, gram +ve, spore forming anaerobe).
- 2 Types

1. Neonatal Cases: babies born to unimmunized mothers and with unhygienic delivery
2. Non-neonatal cases: a/w penetrating injury with dirty object or unsterile injection or otogenic infection

- Incubation Period: 2-14 days
- Clinical features
  - Neonatal Tetanus
    - → Manifests within 3-12 days of birth
    - → Progressive difficulty in sucking & swallowing
    - → Irritability, excessive crying
    - → Paralysis, stiffness & rigidity, spasm without opisthotonus

  - Generalised Tetanus
    - → MC presenting symptom: Trismus or Locked Jaw d/t masseter muscle spasm
    - → Headache, restlessness & irritability
    - → Stiffness, difficulty chewing, dysphagia
    - → Risus sardonicus (typical facial grin)
    - → Opisthotonus (arched posture)

- Treatment
  - Eradication of C. tetani & anaerobic wound environment.
  - Surgical wound debridement if required.
  - Tetanus Ig to neutralize the toxin
  - Control of seizures: antiepileptics
  - Penicillin G → antibiotic of choice
  - Metronidazole, erythromycin or tetracycline for penicillin-allergic patient
  - All patients with generalized tetanus need muscle relaxants (Diazepam)

SCARLET FEVER

00:42:45

- Caused by Group A Streptococcus
- Pharyngitis & strawberry tongue
- Erythematous rash
- Kawasaki disease is a close differential Diagnosis of strawberry tongue
- Identification of GAS in the pharynx-confirms Diagnosis

CLINICAL QUESTIONS

Q. A 3-month-old, asymptomatic infant with H/o TB exposure, has taken 3 months of chemoprophylaxis (isoniazid). What is to be done next?

A. Test sputum and then decide
B. Continue for 3 more months
C. Tuberculin test then decide
D. Immunise with BCG & stop prophylaxis

Answer: B

Solution

- A child born to mother who was diagnosed to have TB in pregnancy should receive prophylaxis for 6 months, provided congenital TB has been ruled out.

Reference: National Guidelines on Pediatric Tuberculosis, 2012;Ghai 9th ed/p- 249

Q. 9 years old child came to your clinic with complaints of fever associated with cough for more than 3 months. You made a diagnosis of pulmonary tuberculosis with help of gene Xpert. In this condition, steroids are not indicated in which of the following condition?

1. Tuberculous meningitis
2. Endobronchial tuberculosis
3. Massive pleural effusion
4. Miliary Tuberculosis

A. Only 1,2,3 is correct
B. Only 2,3,4 is correct
C. Only 1,2,4 is correct
D. All are correct

Answer: D

Solution

Indications of Corticosteroids in TB:

- Tubercular meningitis: reduces vasculitis, inflammation & ICP
- Endobronchial tuberculosis
- Tuberculous massive pleural effusion
- Miliary tuberculosis
- Tuberculous pericardial effusion

Reference: Nelson's 20/e p 1445-1460, Ghai 9/e p 250-258

42 CONGENITAL INFECTIONS

1. CONGENITAL TOXOPLASMOSIS 00:00:28

- Occurs when a woman acquires primary infection during pregnancy.
- Risk of fetal infection increases with each trimester of pregnancy.

Trimester	Risk
1st trimester	15%
2nd trimester	25%
3rd trimester	60%

- Severity of fetal infection is greater in early pregnancy.
- Clinical feature
  - Chorioretinitis
  - Hydrocephalus
  - Cerebral calcifications

  } triad
- Small for gestational age
- Prematurity
- Hydrops fetalis
- Persistent jaundice
- Thrombocytopenia

2. CONGENITAL TB 00:03:37

- Primary / Ghon focus is in liver
- Clinical features
  - Hepatomegaly
  - Conjugated hyperbilirubinemia
- The neonate can acquire postnatal infection from the mother by aerosol route.

3. CONGENITAL SYPHILIS 00:05:15

- **Infection by T. pallidum**
  - Results from transplacental transmission, or during birth, by contact with infectious lesions.
  - Transmission during early pregnancy can result in
    → Fetal loss
    → Prematurity
    → LBW
    → Still birth
    → Neonatal death
- **Early signs of congenital syphilis** 00:07:00
  - Hepatosplenomegaly
  - Jaundice
  - Diffuse lymphadenopathy
  - Painful osteochondritis & periostitis

  ↓

Pseudoparalysis

- Mucocutaneous erythematous, maculopapular rash or vesiculobullous rash : Followed by desquamation, involving hands & feet

Late signs of congenital syphilis 00:08:32

- Olympian brow: Prominent forehead
- Sabre shins: Anterior bowing of tibia
- Higoumenakis sign: Thickening of medial 1/3rd of clavicle
- Hutchinson's Triad
  - Hutchinson teeth (peg shaped / notched teeth)
  - Interstitial keratitis
  - Sensorineural deafness
- Mulberry molars
- Saddle nose
- Rhagades (Scars in spoke like fashion from the mouth)
- Clutton joints: Painless joint swelling involving the knees.
- Prevention for syphilis
  - Prenatal screening for syphilis (VDRL test)
  - Untreated cases: 100% risk of transmission

4. CONGENITAL RUBELLA 00:12:30

- Risk of congenital defects & frequency of congenital infections is highest before 11 wks of gestation
- **Clinical features**
  - **C** – **C**ataract
  - **D** – **D**eafness
  - **C** – **C**ongenital heart disease

  } Triad

Important Information

M/C congenital heart defect in congenital rubella
↓
PDA (Patent ductus arteriosus)
Least common is → Atrial septal defect (ASD)

- Glaucoma, salt & pepper retinopathy
- IUGR, microcephaly
- Hepatosplenomegaly, jaundice
- Thrombocytopenia
- Blue berry muffin lesions: Characteristic of congenital rubella.

5. CONGENITAL CMV

00:16:02

- 90% of infected infants are asymptomatic
- In symptomatic infants
  ↓
  - Hepatosplenomegaly
  - Jaundice
  - Petechiae
  - Microcephaly
  - Chorioretinitis
- Most important long-term sequelae is: Hearing loss
- **Diagnosis of CMV infection**
  - Recovery of replicating virus &/or
  - Viral nucleic acid within 3wk of life from Saliva / Urine / Blood

Important Information

- Urine is the best specimen for this diagnosis by CMV PCR in children

- **Methods used for detection:**
  - Viral culture
  - PCR
  - If microscopy
- CMV IgM: Less sensitivity
- **Rx**: Ganciclovir

6. CONGENITAL VARICELLA

00:19:32

- Seen in 0.4 % of babies infected is 1st trimester 2% of babies infected in 2nd trimester
- **Clinical features**
  - Cicatricial skin scarring in a zoster like or dermatomal distribution
  - Limb hypoplasia
  - LBW
- CNS: Microscopy, seizures, ID
- Eye: Chorioretinitis, microphthalmia, cataract
- Renal: Hydronephrosis
- Autonomic dysfunction: Swallowing dysfunction, neurogenic bladder
- **Diagnosis**
  - H/o varicella during pregnancy
  - C/F in baby
  - Demonstrate anti varicella IgM is baby

CLINICAL QUESTIONS

Q. G1P1 mother was diagnosed positive for the "TORCH" infection came to the hospital for delivery. which of the following infection has the least chance to spread through transplacental route?

A. Hepatitis B virus
B. Rubella virus
C. Herpes Simplex virus
D. Human Immunodeficiency Virus

Answer: C

Solution

- TORCH infection
  - T- Toxoplasmosis
  - O- others (Varicella zoster, syphilis, malaria, TB, HIV, HCV, HBV, Enterovirus, parvovirus, Zika)
  - R-Rubella
  - C-CMV
  - H-HSV
- HSV transmission is mostly during the perinatal period.
- For HSV infection most common mode of transmission is direct contact between mucocutaneous surfaces.
- The transmission of HSV to babies usually **occurs during delivery** in mothers who develop primary genital herpes at that time.

Reference: Ghai 9th ed/p- 264,265

Q. A neonate presented with cicatrizing skin lesions all over the body with hypoplasia of all limbs. A MRI of the brain revealed diffuse cerebral atrophy. An ophthalmologic evaluation reveals chorioretinitis. Which of these tests is most likely to show a positive result in this patient?

A. Anti HCMV antibody
B. Anti toxoplasma antibody
C. Anti VZV antibody
D. Anti rubella antibody

Answer: C

Solution

- Cicatrizing skin lesions, hypoplasia of all limbs and chorioretinitis are all features of Congenital Varicella syndrome
- So, Anti VZV antibody would be positive in this baby.

Reference: Nelson 20e/pg 1581-1583

LEARNING OBJECTIVES

UNIT 12 IMMUNIZATION

- General concepts of immunization
  - Latest NIS 2019
  - Mission Indradhanush
  - Some practical case scenarios
  - FAQs
  - VVM
  - Open vial policy
  - AEFI
  - Immunization in special situations

- Individual vaccines
  - BCG, polio, DPT
  - Measles, pneumococcal
  - Others

43 IMMUNIZATION

- Latest Immunization schedule
- Additional vaccines in IAP guidelines
- Mission Indradhanush
- General principles
- AEFI
- Important points about individual vaccines
- Practical case scenarios
- FAQs

LATEST NATIONAL IMMUNIZATION SCHEDULE (NIS) 2019

00:01:13

- At birth
  - BCG, OPV-0, Hep B- Birth dose
  - BCG can be given upto 1 year of life if not given at birth.
  - OPV-0 can be given upto 15 days of life.
  - Hep-B given within 24 hours of birth.
- At 6 week
  - OPV-1 (can be given upto 5 years)
  - Penta-1 (against diptheria, pertussis, tetanus, hep-B and H. influenza; given upto 1 year)
    - → f-IPV
    - → Rota-1
    - → PCV-1

    (should begin with OPV-1, not later than 1 year)
- At 10 weeks- OPV-2, Penta-2, Rota-2
- At 14 weeks – OPV-3, Penta-3, Rota-3, f-IPV-2, PCV-2
- At 9 completed months: MR-1, PCV-Booster, JE-1, Vit.A-1
- At 16-24 months: DPT-Booster 1, MR-2, OPV-Booster, JE-2, Vit.A-2
  - After vit.A-2, it is given every 6 monthly (total no. of doses- 9)
- At 5-6 Years: DPT Booster-2 (No OPV)
- At 10 & 16 years: Td (instead of TT)

Previous Year's Questions

Q. An unimmunized 13 months old child comes to you in OPD. according to the latest immunization schedule. what vaccines will you advice? (AIIMS May 2018)

A. OPV 3 doses. 1 IPV .3 Pentavalent
B. BCG. OPV 3 doses. 3 IPV. 3 Pentavalent. 1 measles
C. OPV 3 doses. 1 IPV .3 Pentavalent. 2 measles
D. OPV 3 doses. 3 IPV. 3 DPT. Hep B

FULLY IMMUNIZED CHILD

- A child who has received all vaccines recommended by NIS till 1 year of age. i.e.,
  - 3 doses of OPV
  - 3 doses of Penta
  - 2 doses of f-IPV
  - 1 dose of MR
  - 3 doses of Rota*
  - 3 doses of PCV*
  - 1st dose of JE*

COMPLETELY IMMUNIZED CHILD

- Received all vaccines till 2 years of age.
- i.e., All above vaccines plus
  - MR 2nd dose
  - DPT: B_1
  - OPV: B
  - JE: 2nd dose

ADDITIONAL VACCINES IN IAP GUIDELINES

- Typhoid conjugate vaccine
- HEP A
- Varicella
- HPV

MISSION INDRADHANUSH

00:14:50

- Launched by Ministry of Health & Family welfare, Government of india on 25th Dec 2014.
- To improve full immunization coverage from 65% in 2014 to atleast 90% over next 5 years through special catchup drives.
- It included vaccines against
  - TB
  - Diphtheria
  - Pertussis
  - Tetanus
  - Polio
  - Measles
  - Hep B

GENERAL PRINCIPLES OF IMMUNIZATION IN CHILDREN

00:16:55

- Any number of vaccines – live or killed may be given on the same day, maintaining a gap of at least 5 cm between different vaccines.
- Inactivated or killed vaccines can be given any time in

relation to any other live / killed vaccine.
- If missed on a single day, a gap of at least 4 weeks should be there between any 2 live vaccines.

PRACTICAL CASE SCENARIOS 00:19:44

Q. If a child has upper respiratory infection on due date of vaccination, what to do?
- Minor illness is not C/I for vaccination.
- Give the vaccines that are due.
- To be postponed only during serious illness.

Q. Vomiting after OPV
- If vomiting within 30 minutes → repeat OPV

Q. Lapsed immunization:
- No need to restart vaccine series, regardless of the time elapsed.
- Give the due vaccine as per schedule.

Q. Preponed immunization:
- If given 5 or more days before due date, that dose is not counted.
- You have to repeat it.

Q. Unknown immunization status:
- Child should be considered unimmunized & vaccinated accordingly.

Q. What vaccines should be given to an unimmunized child?
- MR (Measles Rubella)
- DTP (>7 years - Tdap)
- Hib (<5 years)
- OPV (<5 years)
- BCG (<1 year)
- Hep B (<1 year)

FAQs 00:26:25

- Vaccines C/I in Egg allergy
  - Yellow fever vaccine
  - Influenza vaccine
- Vaccines causing thrombocytopenia
  - Measles vaccine
- Strains included in meningococcal Vaccine
  - A, C, Y, W-135
- Heat sensitive vaccines
  - OPV, Reconstituted BCG, Measles vaccine
- Light sensitive vaccines-
  - Measles vaccine, BCG, Rota, JE vaccine
- Freeze sensitive vaccines-
  - Hep B, Pentavalent, TT, DPT vaccine

VVM – Vaccine Vial Monitor 00:29:02

- Heat sensitive label that indicates cumulative heat exposure over time.
- If color of inside square is lighter than the outside circle

  ↓

  We can use the vaccine, if the expiry date has not elapsed.
  - E.g., VVM – 7: The number indicates the number of days the vaccine remains potent when exposed to 37°C

Important Information

Test done to check for cold damage to Vaccine due to freezing: "Shake test"

Previous Year's Questions

Q. Heat sensitive device present on the vaccine vial to monitor its viability? (INICET NOV 2020)

A. MMV
B. MVM
C. VMM
D. VVM

OPEN VIAL POLICY 00:33:09

- The latest update.
- It allows the reuse of partially used multi-dose vials in subsequent immunization sessions (up to 4 weeks) provided
  - Expiry date not reached
  - Cold chain maintained
  - Date of opening the vial clearly mentioned
  - Aseptic technique used to withdraw vaccine
  - Vaccine vial septum not submerged in water
  - Open Vial Policy is applicable for:
    - → DPT
    - → TT
    - → Hep-B
    - → PCV

- → Pentavalent
- → OPV
- → IPV

- Open vial policy is not applicable for:
  - → Measles/MR
  - → BCG
  - → Rota
  - → JE

Vaccines recommended in adolescents 00:37:35

- Tdap - Influenza
- Td - JE
- TT - Pneumococcal
- HPV - Rabies

Cocoon Strategy 00:38:22

- Vaccination of persons from immediate environment of persons who are susceptible to a disease but cannot be immunized.

Recommended sequence in which vaccines should be given 00:40:03

- Oral → Intradermal → SC → IM
  (OPV, Rota) (f-IPV) (MR) (Pentavalent)

AEFI – ADVERSE EVENTS FOLLOWING IMMUNIZATION 00:41:38

- Definition: Any untoward medical occurrence which follows immunization but does not necessarily has a causal relationship with the usage of vaccine.

Classification of AEFI 00:43:14

I. **Vaccine Related**

a. Vaccine product related – AEFI caused or precipitated by a vaccine, due to 1 or more inherent properties of vaccine product.

b. Vaccine quality defect related reactions - due to 1 or more quality defects in vaccine

Clinical classification of vaccine reactions can be:

- Common / Minor reactions: Local pain, redness, swelling
- Serious reactions: Death, disability, Hospitalization or cluster of 2 or more cases in a geographical area.
- Severe reaction: Neither minor nor serious
  - E.g. Persistent cry, anaphylaxis: requiring OPD treatment

II. **Program Error**: Caused by inappropriate vaccine handling, prescription or administration. It is a preventable reaction.

III. **Injection Reaction**: Due to anxiety about injection. E.g. Syncope

IV. **Co-Incidental Event**: AEFI Caused by something other than the vaccine product, program error or injection reaction. E.g Sudden infant Death syndrome following any vaccination.

IMMUNISATION IN SPECIAL SITUATIONS 00:50:49

A. Immunocompromised children:

- All inactivated or killed vaccines may be given, but the immunogenicity or efficacy is lower.
- In severe immunodeficiency, all live vaccines are contraindicated. Household contacts should also not receive transmissible live vaccines like OPV.
- In these children, pneumococcal vaccine, Hep-A vaccine and inactivated influenza vaccine should be given.

1. HIV positive: IAP, WHO & CDC recommend:
   - All live vaccines should be given to asymptomatic HIV-1 infected children except OPV.
   - All killed vaccines can be given.
   - In symptomatic children, live vaccines are C/I.
2. Drug induced immunodeficiency
   - If a child is on oral corticosteroid ≥ 2 mg/kg/day or ≥ 20mg/day (nephrotic syndrome) or a cancer patient on chemo/radio therapy or a stem cell transplant recipient:
   - Should not receive live vaccines till 1 month of discontinuation of steroids.
   - Killed vaccines can be safely given.
   - Annual inactivated influenza vaccine should be given.
   - Pneumococcal vaccination should be done at diagnosis, before starting treatment.
   - Siblings of these children should not receive OPV(transmissible live vaccines).
   - Children on inhaled or topical corticosteroids, there is no C/I to any vaccine.

Important Information

- **If a cancer patient comes in contact with a patient with chickenpox.**

Estimate VZV IgG levels:

If more than the protective level	if less than the protective level
↓	↓
Oral acyclovir	VZV Ig/IvIg + oral acyclovir

3. Primary immunodeficiency:
   - In all children with severe B cell defect (e.g, X-linked Agammaglobinemia) or severe T cell defect (eg., SCID), all live vaccines are C/I.

B. Planned splenectomy: At least 2 weeks prior, initiate immunization:

- Pneumococcal vaccine
- Hib vaccine
- Meningococcal vaccine
- Typhoid vaccine

C. Known bleeding or coagulation disorder(Hemophilia) or a child is on anticoagulant therapy:
- Avoid IM injections
- Give it SC if possible. Eg.,Hib, pneumococcal polysaccharide vaccine or IPV.
- If IM injection needs to be given, schedule shortly after administration of clotting factor replacement.
- Use 23 G or smaller vaccine.
- Apply firm pressure over area for 5-10 minutes after injection.

D. Preterm/ LBW babies:
- All vaccines can be administered as per Schedule according to chronological age irrespective of birth weight or gestational age.
- Birth vaccines like OPV-0 & BCG should be given preferably, at the time of discharge (after stabilisation

Previous Year's Questions

Q. A female child has recurrent candidiasis and respiratory virus infections since she was 3 months old. Now immunodeficiency work- up is being considered. Which is contraindicated?

A. TT/Td
B. Measles/ MMR
C. DPT
D. Killed IPV

Previous Year's Questions

Q. A 5 yr old unimmunized child developed diphtheria. He has a 3 yr old immunized sibling contact. who received last booster 18 months back. What to do with the contact? (NEET JAN 2020)

A. Two doses of polysaccharide vaccine
B. Three doses of conjugate vaccine
C. Single dose of toxoid vaccine
D. No vaccine needed

CLINICAL QUESTIONS

Q. After the massive tsunami, lakhs of people were left homeless and had many injuries while saving themselves or others. After few days when the scenario was quite better than before, stranded people were moved to safer places and immediately sent to hospitals on the basis of triage. Mass vaccination for communicable diseases was carried out to provide herd immunity. Which vaccine given was not effective in providing herd immunity?

A. Measles
B. Poliomyelitis
C. Tetanus
D. None of the above

Answer: C

Solution

Herd Immunity:

- Reduction of infection/disease in unimmunized segment as a result of immunizing a proportion of population.
- It is d/t reduced carriage of the causative microorganism by the vaccinated cohort
- Thus, seen only with vaccines against those diseases where humans are the only source
- An **effective vaccine** is **prerequisite** for good herd effect. **e.g.** conjugated pneumococcal vaccine
- **Tetanus** & **BCG** vaccines have **no** herd effect. So, mass vaccination is ineffective.

Reference: Ghai 9/e pg- 191,192,193

Q. For the next polio round in a village, the polio vaccine has reached the subcenter and on the final day when the health worker was checking the polio vials for Vaccine vial monitor. On what does the efficiency of oral polio vaccine depends as monitored by VVM?

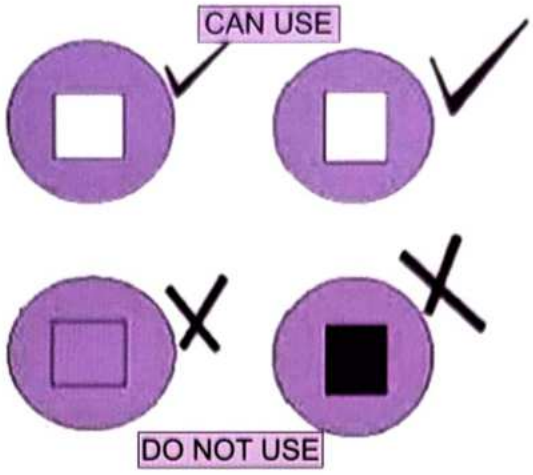
A. Change in the colour of vaccine
B. Temperature indicator of the system
C. Viral potency test
D. Change in colour of monitor

Answer: D

Solution

Vaccine Vial Monitor (VVM)

- Heat sensitive label that indicates cumulative heat exposure over time.
- Whether the OPV vial can be used or not depends upon the irreversible colour changes in vaccine vial monitor.
- If color of inside square lighter than outside circle → We can use the vaccine



Reference: Ghai 9/e pg-203

44 INDIVIDUAL VACCINES

1. BCG Vaccine

00:00:21

- **Strain:** Copenhagen (Danish 1331) or Pasteur
- Light sensitive vaccine (in dark coloured ampoules)
- LA vaccine
- Available as Lyophilized form
- NS is used as diluent
- Dosage: 0.05 ml
- Route: Intradermal
- Induces CMI
- Protects against severe forms of TB: TB meningitis/ Disseminated TB

Previous Year's Questions

Q. BCG is maximally protective against?
(AIIMS Nov 2018)

A. pulmonary TB
B. pulmonary and CNS TB
C. CNS and disseminated TB
D. Extra pulmonary TB

2. Polio Vaccine

00:03:02

- 2 Types

1. OPV or sabin: Live
2. IPL or salk: Killed

- OPV used currently is bivalent: which contains P_1 & P_2 strains
- OPV P_2 was globally discontinued in April 2016
- WHO advocates at least, 1 dose of IPV in national immunization schedule.
- WHO no longer advocates OPV only schedule because IPV protects against wild polio virus as well as polio caused by cVDPV-2

VAPP: Vaccine Associated Paralytic Polio

- Cases of AFP, which have residual weakness 60 days after onset of paralysis and from whose stool samples, vaccine related but not wild polio virus has been isolated.

VDPV: Vaccine Derived Polio Virus

- Arises due to mutation and recombination of vaccine derived polio virus in human gut which are 1-15% divergent from parent vaccine strain.

3. Hep B Vaccine

00:08:52

- Birth dose is to prevent Hep B transmission from mother to baby.
- Should be given within 24 hours of birth

Hep B status of Mother	Intervention
1. HBsAG positive	• HB Ig & HBV within 12 hours of birth • Complete Hep B vaccines at 2, 6 months
2. HbsAg Unknown	• HBV within 12 hours • Send mother HBS status: ○ If HBsAg positive → HB Ig within 7 days of life ○ Complete Hep B vaccine at 2 and 6 months
3. HBsAg negative	• Complete Hep B at 0 and 6, 10, 14 weeks

4. DPT vaccine

00:12:25

- Most adverse effects are due to pertussis component
- Severe adverse effects:
  - Persistent inconsolable screaming
  - Seizures
  - Hypotonic Hyporesponsive episodes
  - Encephalopathy
  - Anaphylaxis
- C/I to DPT vaccine
  - Progressive neurological illness
  - Anaphylaxis to previous dose of DPT vaccine
  - Encephalopathy with 7 days of vaccination.
- Catch up vaccination
  - < 7 years: DPT at 0, 1, 6 months
  - 7 years: Tdap at presentation, f/b Td at 1 and 6 months

5. Measles and Rubella Vaccine

00:15:21

- Measles
  - Live attenuated vaccine

- Edmonton Zagreb strain
- Diluent: Distilled water
- Route: SC
- MR vaccine at 9 months and 16-24 months
- IAP: 9, 15 months, 4 – 6 years (MMR)
- Adverse effects
  - → Local pain/ tenderness
  - → Mild measles like illness
  - → Thrombocytopenia

6. Pneumococcal vaccine

00:17:55

PCV (Conjugate)	PPSV (Polysaccharide)
• 13 valent • Can be given @ < 2 years	• 23 strains • Immunogenic beyond 2 years of age • Has low immune memory • No herd immunity

Important Information

- Recommendation about immunisation prior to splenectomy: Hib, pneumococcal and Meningococcal (at least 2 weeks before splenectomy)

Previous Year's Questions

Q. All of the following will be benefitted by the 23-valent pneumococcal vaccine except?
(AIIMS Nov 2019)

A. Recurrent otitis media
B. Cystic fibrosis
C. Sickle cell anemia
D. Less than 2 years
E. Lupus nephritis

7. Rotavirus Vaccine

00:20:53

- Live oral vaccine
- @ 6, 10 and 14 weeks (maximum age 1 year)
- Strain: 116E strain (Indian origin) used in NIS
- S/E: Intussusception

8. Hep A Vaccine

00:22:01

- Live Vaccine: 12 – 23 months
- Inactivated vaccine: 2 doses, 6 months apart (starting at 1 year of age)

9. Influenza Vaccine

00:22:41

- Inactivated vaccine: Whole virus/ split product
- Live attenuated: Nasal spray
- Regime: 2 dose IM, 4 weeks apart f/b 1 dose annually

Strains in 2018-2019 influenza vaccine

- A/ Michigan/ H_1N_1
- A/ Singapore/ H_3N_2
- B/Colorado (Victoria lineage)
- B/ Phukat (Yamageta lineage)

Previous Year's Questions

Q. which vaccine is to be given every year?
(NEET Jan 2019)

A. Hep A
B. Pneumococcal
C. Influenza
D. Chicken pox

10. Typhoid Vaccine

00:25:14

- **Vi capsular polysaccharide vaccine**
  - Not immunogenic < 2 years age
  - No immune memory
  - Efficacy 50 – 60%
  - Recommended ≥2 years age f/b re-vaccination every 3 years.
- **Typhoid conjugate Vaccine**
  - Can be given 6 months age onwards
  - Single dose
  - Efficacy ~90%
  - An unimmunized child who had enteric fever should be given typhoid vaccine, 4 weeks after full recovery.

11. Varicella vaccine

00:28:11

- Live Attenuated
- OKA strain
- SC: 2 doses
  - 15 months
  - 4 – 6 years
- IAP recommends to all children with no previous H/o varicella
- For Post-exposure prophylaxis, should be given preferably within 3 days of exposure but potentially upto to 5 days of exposure

12. HPV vaccine

- 2 recombinant DNA vaccine:

- Quadrivalent (Gardasil): HPV serotypes 6, 11, 16, 18
- Bivalent (Cervarix): HPV 16, 18

- 99-100% efficacy against vaccine type related genital warts and vaginal and vulval neoplasia.
- Minimum age: 9 years
- Catch up: 13 – 45 years

Previous Year's Questions

Q. A 16 yr unmarried girl came for vaccination against cervical cancer. Which of the following vaccines can be given? (AIIMS Nov 2019)

A. Gardasil
B. R-vac
C. Biovac A
D. Tdap

CLINICAL QUESTIONS

Q. A vaccination drive carried out for children and adults after floods in Kerala. Vaccines were given according to the requirement to both the groups. Which out of the following vaccines can not be used in case of adults?

A. Hep A
B. MMR
C. DPT
D. Pneumococcal

Answer: C

Solution

- Tdap vaccine (single dose) is recommended in adolescents / adults & not DTP
- DTP cannot be given beyond 7yrs of age.
- Tdap contains a lesser amount of Diphtheria & Pertussis antigens, compared to DTP
- Remaining all vaccines given in the question can be given to adults according to requirement.

EXTRA EDGE:

- **Vaccines recommended in adolescents:**
  - Tdap
  - HPV
  - Td
  - Influenza
  - TT
  - JE
  - Pneumococcal
  - Rabies

Reference: Ghai 9th edition, pg-187

Q. An eight-months-old child had a history of unusual crying, altered sensorium & convulsions following previous vaccination after BCG, DPT & OPV (first dose) & Hepatitis B. Now parents have brought child for next doses of vaccination. Which vaccine is contraindicated in this situation?

A. Measles
B. DPT
C. Hepatitis B
D. DT

Answer: B

Solution

- **Absolute contraindications to any pertussis vaccination (including DTwP vaccine) are →Anaphylaxis** after previous dose.
- Development of **encephalopathy** within 7 days following previous DTwP vaccination - Progressive neurological disease

→ **Relative contraindication** [administer DT / dT instead].

- **Precautions:** Previous dose associated with
  - **Persistent inconsolable crying of** > 3 hrs, < 48hrs
  - **Hyperpyrexia** (fever > 40.5°C)
  - **Hypotonic hyporesponsive episodes** (HHE) within 48 hours of DTwP administration
  - **Seizures with/without** fever within 72 hours of administration of DTwP
- These are considered as **precautions** but not a contraindication to future doses of DTwP because these events generally do not reoccur with the next dose and they haven't been proven to cause permanent sequelae.
- But in case an event recurs with a subsequent dose, then further doses are contraindicated.

Reference: Ghai 9th edition, pg-190

LEARNING OBJECTIVES

UNIT 13 PEDIATRIC CARDIOLOGY

- Fetal circulation & classification of congenital heart disease
  - Fetal circulation in detail
  - NADA criteria
  - Classification of congenital heart diseases

- Imp. Acyanotic CHDs
  - VSD
  - ASD
  - PDA

- TOF

Other congenital heart diseases
- Truncus arteriosus
- TAPVC
- TGA
- Coarctation of aorta
- Tricuspid atresia
- Ebstein anomaly

- RHD

- Image based questions

45 FETAL CIRCULATION & CLASSIFICATION OF CONGENITAL HEART DISEASES

DIFFERENCES BETWEEN FETAL CIRCULATION & ADULT CIRCULATION

00:01:24

1. Source of O_2
- Fetal circulation: Placenta
- Adult circulation: Lungs
2. In fetal life, lungs are collapsed & pulmonary vascular resistance is very high: very little blood goes to lungs
3. Ductus arteriosus
4. Ductus venosus
5. Foramen ovale

} Important for fetal circulation

Important Information

- Chambered structure of heart appeared by 6th week of IUL

FETAL CIRCULATION

00:04:10

Refer Figure 45.1

Umbilical cord

- contains 1 vein & 2 arteries, rudimentary allantois, remnant of omphalomesenteric duct, Wharton jelly.
- umbilical vein carries oxygenated blood (SpO_2- 80%)
- single umbilical artery
  - 5-10/1000 births
  - Associated with increased risk of renal anomaly
  - MC in twin pregnancy
  - Trisomy 18
- Delayed fall of umbilical cord seen in Leukocyte adhesion defect (a form of immunodeficiency)

Saturation of O2 in fetal circulation

- Umbilical vein: 80% (maximum in the entire body of fetus)
- Inferior vena cava (IVC): 70% (seen in deoxygenated blood also so saturation level falls)
- LV: 65%
- RV: 55-60%
- Umbilical artery: very low

Changes in circulation at or after birth 00:23:48

1. Lungs become the source of O_2 instead of placenta
2. Pulmonary vascular resistance decreases: Blood flow to lung increases(systolic murmur)
3. Systemic vascular resistance increases
4. Foramen ovale closes
5. Ductus venosus closes -forms ligamentum venosus, Funtional closure: 10-96 hrs, Anatomical closure: 2-3 weeks
6. Ductus arteriosus closes- forms ligamentum arteriosus (PROSTAGLANDINS plays an important role)
- Functional closure: immediately after birth at 10-15 hrs (due to smooth muscle contraction)
- Anatomical closure: D_{15}-D_{21} of life (due to proliferation of cells of intima of ductus arteriosus)

Previous Year's Questions

Q. In a fetus, highest O2 concentration is found in? (NEET JAN 2020)

A. IVC
B. SVC
C. LV
D. AA

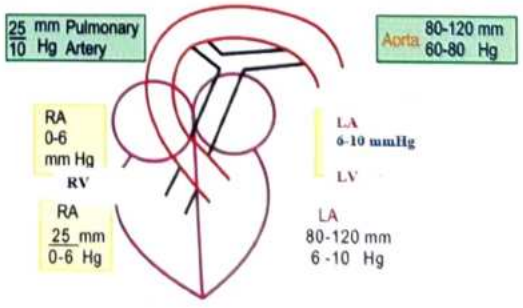
Previous Year's Questions

Q. Most oxygenated fetal vessel? (JIPMER Nov 2018)

A. Umbilical artery
B. Ductus arteriosus
C. Umbilical vein
D. Ductus venosus

PRESSURES IN DIFFERENT CHAMBERS OF HEART IN ADULT CIRCULATION

00:30:41



- These pressures normally get established by 2-3 weeks of age
- In presence of VSD or PDA, these pressures get established by 6-10 weeks age

NADA'S CRITERIA

00:35:39

- It is used to assess the presence of congenital heart disease
- 1 major or 2 minor criteria indicates possibility of Congenital Heart Disease

Major Criteria

- Systolic murmur ≥ Grade 3
- Any diastolic murmur
- Cyanosis
- Congestive heart failure

Important Information

Chyperoxia Test

- To see the presence of CHD now a days.
- Put the baby under O2 by hood (100%)-do ABG analysis: if paO2 >150 mmHg, then CHD is ruled out

Minor Criteria

- Systolic murmur < Grade 3
- Abnormal S_2
- Abnormal BP
- Abnormal ECG
- Abnormal Chest X-ray

CLASSIFICATION OF CONGENITAL HEART DISEASES

00:40:45

(Based on pathophysiology)

Classification of congenital heat diseases

L → R shunt	Complete mixing of blood of L & R side	Parallel Circulation	Ductus Dependent	
			Systemic circulation	Pulmonary circ
• VSD • ASD • PDA (**Note**: R to L Eisenmenger syndrome)	• Truncus arteriosus • TAPVC	• TGA	• Critical AS • Severe coarctation of aorta • Interrupted aortic arch • HLHS (CHD MC causes mortality in 1st week of life)	• Severe PS • Severe TOF • Pulm. atresia • Tricuspid atresia • Ebstein anomaly

Ductus Dependent

Systemic circulation

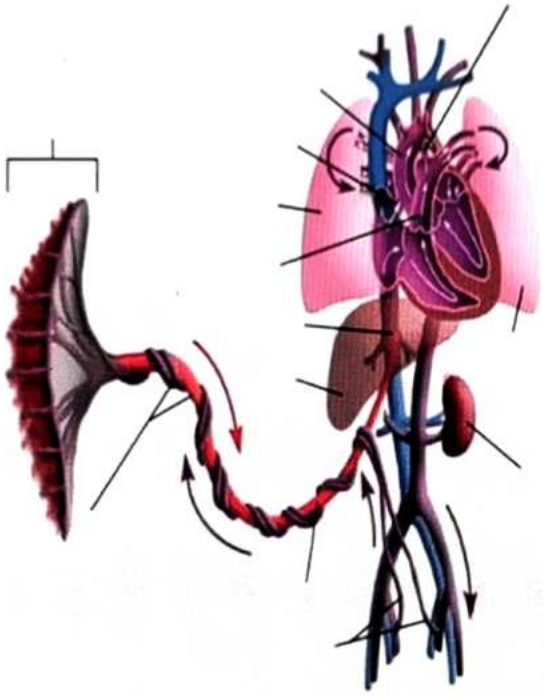
Portal vein
[55-60%] RV
U.Vein (80%)
umbilical artery
u. cord
Placenta

CLINICAL QUESTIONS

Q. Which of the following statements are correct about the below-depicted image?



1. The image describes the fetal circulation
2. The upper part of the fetal body receives more oxygenated blood than the lower part of the body
3. Umbilical venous blood bypasses the hepatic circulation through ductus arteriosus
4. The placenta is not as efficient as the lungs in oxygen exchange.

A. Only 1,2,3 is correct
B. Only 1,2,4 is correct
C. Only 1,2 is correct
D. Only 1 is correct

Answer: B

Solution

- The above question describes the fetal circulation
- The upper part of the fetal body receives more oxygenated blood than the lower part of the body because of the bypass done by foramen ovale
- Oxygenated blood from the placenta → umbilical vein → 50% bypasses liver through ductus venosus → Inferior vena cava → Right atrium → Foramen ovale → Left atrium → Left ventricle → aorta → to upper parts of the body
- Only a small amount of blood passes through the aortic arch and reach the descending aorta
- Deoxygenated blood from superior vena cava → superior vena cava → right atrium → right ventricle → Only a small

amount of blood enters pulmonary circulation since the pulmonary artery is constricted → the remaining reaches the descending aorta through ductus arteriosus

- Thus, the blood supply to the lower parts of the body preferentially comes from the right ventricle, and the upper parts of the body receive from the left ventricle
- This is how blood reaching the upper parts of the fetal body is more oxygenated than the lower parts of the body
- Umbilical vein: carries oxygenated, nutrient-rich blood from placenta to fetus
- Umbilical arteries: carries deoxygenated blood from fetus to placenta for oxygenation
- Ductus venosus: shunt that allows oxygenated blood from umbilical veins directly into inferior vena cava [bypass liver]
- Hypogastric artery: aka internal iliac artery: Supplies pelvic viscera

Reference: Nelson's 20/e p 2161-2162, Ghai 8/e p 402

Q. Upon understanding the fetal circulation your professor questioned you to choose the correct order of blood vessels in the fetus in which the oxygen saturation is from maximum to minimum?

A. Umbilical vein > Ductus venosus > Inferior vena cava > Ascending aorta > Descending Aorta > Umbilical arteries
B. Umbilical arteries > Ductus venosus > Inferior vena cava > Ascending aorta > Descending Aorta > Umbilical vein
C. Umbilical vein > Ascending aorta > Inferior vena cava > Ductus venosus > Descending Aorta > Umbilical arteries
D. Umbilical arteries > Inferior vena cava > Ascending aorta > Ductus venosus > Descending Aorta > Umbilical vein

Answer: A

Solution

- Oxygen saturation of various blood vessels in the fetus:
  - Umbilical vein [SpO2 80% of maximum saturation] > venous duct > inferior vena cava [70%] > ascending aorta > descending aorta > umbilical arteries [lower Spo2]

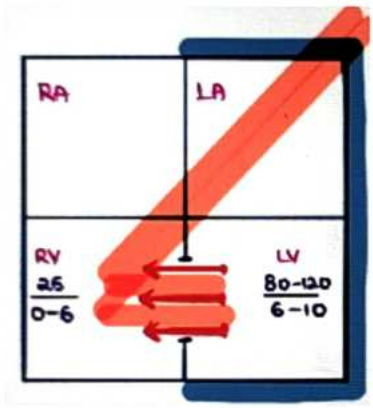
Reference: Ghai 9th ed pg 400

46 IMPORTANT ACYANOTIC CONGENITAL HEART DISEASES

VENTRICULAR SEPTAL DEFECT 00:00:31

- MC congenital heart disease in children
- MC congenital acyanotic heart disease in children
- MC congenital heart diseases affected by infective endocarditis in children
- 90% VSDs involve membranous part (10% muscular part)

Hemodynamics of VSD



Auscultation Findings

- Pansystolic murmur (blood moves from left to right with a gush)
- In large VSD
  - Delayed diastolic murmur in mitral area
  - Ejection systolic murmur in pulmonary area
- Chambers enlarged: Left Atrium & Left Ventricle. (Since excess blood goes into lungs through pulmonary circulation, it comes back into LA so LA & LV enlarged)

Clinical features

- Recurrent episodes of pneumonia [Tachypnea]
- Heart failure & failure to thrive (child doesn't gain weight adequately)
- Usually presents at 6-10 weeks

ECG Findings

- Left axis deviation [normally all babies at birth have right axis deviation]
- Left ventricular hypertrophy

Chest X-ray findings

- Cardiomegaly with LV apex (moves down & out)
- Pulmonary plethora d/t excess blood going to lungs

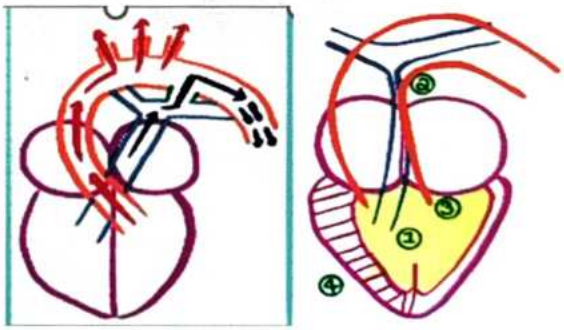
Treatment

Medical management	Surgical management
1. Treatment of Heart failure • Digoxin • Furosemide management 2. Treatment of pneumonia with Antibiotics & supportive care 3. Nutritional rehabilitation	Closure of VSD by DACRON PATCH **Indications** 1. Heart failure refractory to medical 2. If pulmonary blood flow (QP) is more than double of systemic blood flow (Qs) [Qp: Qs> 2:1]

Complications of VSD

1. Infective endocarditis: VSD + fever + Clubbing without cyanosis
2. Eisenmenger syndrome: VSD + Clubbing + Cyanosis [no fever]

EISENMENGER SYNDROME 00:21:38



- Reversal of shunt at the level of VSD/ASD/PDA due to irreversible pulmonary vascular obstructive changes
- **Pathophysiology**

VSD [Left → Right]
↓
Excess pulmonary blood flow
↓
Hyperkinetic pulmonary hypertension[reversible]
↓

Irreversible pulmonary vascular obstructive changes
[obstructive pulmonary HTN]
↓
Rt ventricular hypertrophy
↓
Pressure in RV increases
↓
When RV increases >LV pressure
↓
Right → Left shunt
↓
Cyanosis & clubbing

Previous Year's Questions

Q. On repair of VSD, the patient will show improvement in which of the following?
(AIIMS JUNE 2020)

A. Arrythmia
B. Heart block
C. Respiratory alkalosis
D. Failure to thrive

ATRIAL SEPTAL DEFECT (ASD)

00:29:57

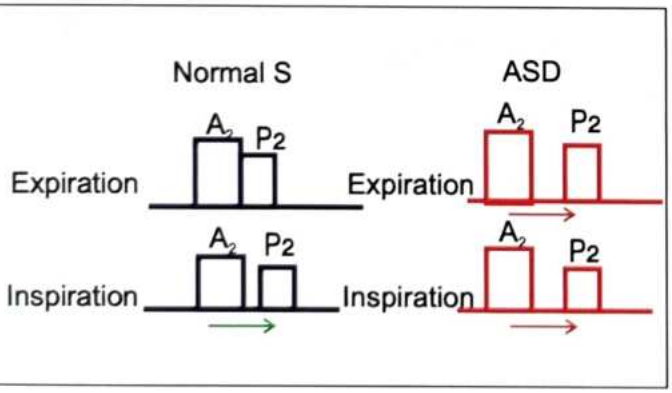
- 2 Main Types
  1. OSTIUM PRIMUM
  2. OSTIUM SECUNDUM [MC Type]

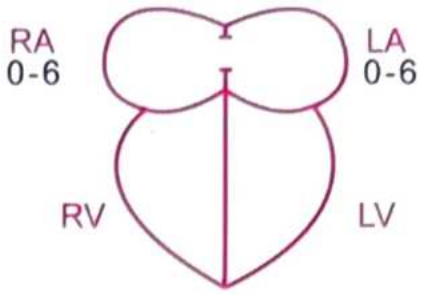
OSTIUM SECUNDUM ASD

Hemodynamics

- Shunt remains silent in ASD (No Murmur)

Normal S_2





- Irrespective of inspiration or expiration, Right atrium has more blood (as it is receiving blood from Superior Vena cava, Inferior Vena cava and Left Atrium)
- Right ventricle takes more time to empty, P_2 comes later
- Wide, Fixed Split of S2 : also in TAPVC, RBBB
- Large ASD Produce Murmurs
  - Diastolic murmur in tricuspid area
  - Ejection systolic murmur in pulmonary area

Clinical Presentation

- Small ASD: Asymptomatic throughout life
- Large ASD: Same as VSD

Investigations

ECG findings

- Right axis deviation in ostium Secundum ASD
- Left axis deviation in ostium Primum ASD

Treatment

- Asymptomatic: no treatment required
- Symptomatic: same as VSD

Important Information

- Congenital heart disease which is least commonly affected by Infective endocarditis: ASD

Important Information

Congenital Rubella Syndrome

- Cataract
- Deafness
- Congenital heart disease (MC is PDA. Least common is ASD)

Syndromes Associated With ASD

1. **P** - Pierre Robin Sequence
2. **TAR** - TAR [Thrombocytopenia Absent Radius] Syndrome

3. F - Fetal Alcohol syndrome
4. E - Ehler Danlos Syndrome
5. D - Down Syndrome
6. H - Holt-Oram syndrome
7. E - Ellisvan Creveld Syndrome
8. R - Rubinstein Taybi syndrome

How to remember

- PeTAR FED HER

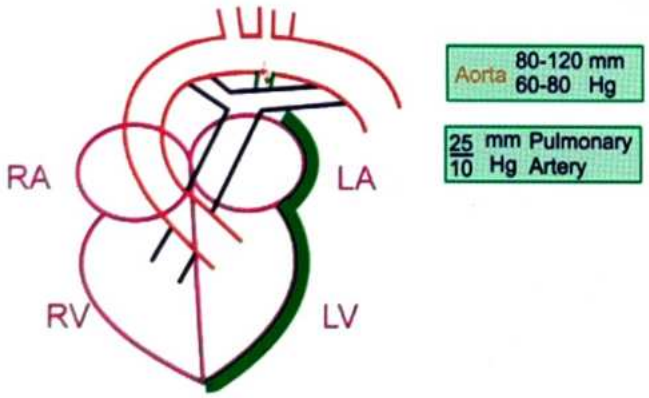
Important Information

- Atrial Septal Defect is not associated with Turner syndrome
- Atrial Septal Defect is not a component of TOF
- Atrial Septal Defect is a component of Trilogy of Fallot & Pentalogy of Fallot
- Pentalogy of Fallot TOF + ASD
- Trilogy of Fallot Pulmonary Stenosis + Atrial Septal Defect + Right Ventricular Hypertrophy

PATENT DUCTUS ARTERIOSUS 00:57:40

- Ductus arteriosus connects aorta to pulmonary artery
- Hypoxia & prematurity predispose to PDA

Hemodynamics



- **Auscultation**: Continuous machinery murmur - 'drrrr sound' (as huge difference between pressures in aorta & pulmonary artery)
- Left side of heart enlarged (LA+LV increased in size) (excess blood from ascending aorta enters pulmonary artery into lungs)
- **Clinical Presentation**: same as VSD
  - Term Neonates: presents at 6-10 weeks
  - Preterm Neonate: presents at 1st week
- **Investigation**: CXR & ECG findings are same as VSD
- **Treatment**: For term babies same as VSD

I. Medical Management
   - Treatment of heart failure
   - Treatment of pneumonia
   - Nutritional rehabilitation

II. Surgical Management
   - Ligation of PDA
   - Coil embolization of PDA
   - Indications of Surgery
     → Heart failure refractory to medical Management
     → Qp (Pulmonary blood flow): Q_s (Systemic blood flow) > 2:1

Important Information

1. Differential cyanosis is seen in pda with reversal of shunt [Eisenmenger Syndrome]
   - No cyanosis in upper limbs (as oxygen blood goes us there)
   - Cyanosis in lower limbs (mixing of blood with deoxygenated blood)
2. DOC for medical closure of PDA in preterm neonate: PG Inhibitors [Indomethacin: Ibuprofen- preferred due to less side effects]

CLINICAL QUESTIONS

Q. A 23-year-old male presented with an eight-month history of shortness of breath and palpitations. Additionally, he had a recent history of paroxysmal atrial fibrillation. An echocardiogram demonstrated an atrial septal defect (ASD), a severely dilated right atrium, and ventricle. Which of the following is the most common type of ASD?

A. Ostium primum
B. Ostium secundum
C. Coronary sinus defect
D. Sinus venosus type

Answer: B

Solution
Types of ASD:

Name	Remarks
Ostium secundum	Located in the central portion of atrial septum; Most common type of ASD
Ostium primum	Located at lower part of the atrial septum
Sinus venosus defect	Located at junction of superior vena cava and right atrium
Coronary sinus defect	Refers to unroofed coronary sinus which is a rare communication between the coronary sinus and the left atrium

Reference: O.P Ghai 8th e/ pg. 413

Q. A female neonate born in 37th week of first pregnancy through cesarean section presents to the hospital as below-depicted image. X-ray reveals congenital upper limb defects. Further examination reveals the presence of heart murmur. Which of the following is characterized in this defect?

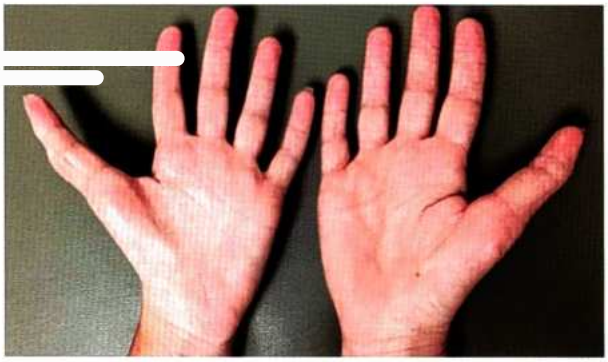
A. ASD
B. VSD
C. TGA
D. TAPVC

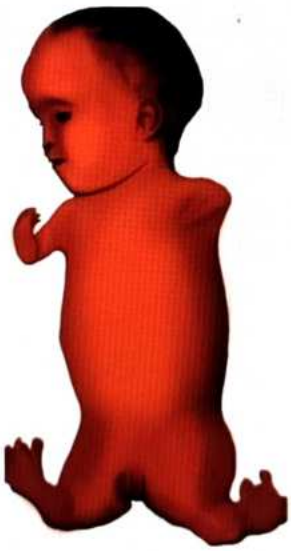
Answer: A

Solution

- **The above scenario is seen in Holt- Oram syndrome.**
- **Holt-Oram syndrome:**
  - Autosomal dominant disorder
- Characterized by
  - **skeletal abnormalities of hands and arms like:**
    - → Hypoplastic/ absent thumbs, radii
    - → Triphalangism
    - → Phocomelia
- **Cardiac anomalies**
  - ASD
    - → 1st-degree heart block

TRIPHALANGISM





Phocomelia

Reference: Nelson's 20/e, Vol-2, p 2189-2191

47 TETRALOGY OF FALLOT (TOF)

- MC congenital cyanotic heart disease in children
- **4 components**
  1. Large, nonrestricted VSD
  2. Right ventricular outflow tract obstruction (RVOT) or pulmonary stenosis(infundibular>valvular)
  3. Overriding of aorta
  4. Right ventricular hypertrophy
- **Timing of presentation & severity will depend on**
  - Degree of pulmonary stenosis
  - Ductus arteriosus open or not
- **Clinical features**
  a. Cyanosis(central) due to hypoxia :spo2=75-85%
  b. Clubbing
  c. Polycythemia
  d. Cyanotic spells
  e. Dyspnoea on exertion (improves on squatting)
  f. Heart failure is not seen in TOF, unless it is complicated by
  - Anemia
  - Infective endocarditis
  - Myocarditis
  - Systemic hypertension
- **Age of presentation depends on severity**
  - Mild PS: pink TOF
  - Mild to mod.TOF: present after 1st few months of life
  - Severe TOF: cyanosis even at birth
- TOF with pulmonary atresia: blood goes to the lungs via ductus arteriosus(PDA) or via MAPVA (multiple aorto-pulmonary collateral arteries)
- Cyanotic spells MC in infants with mild TOF because compensatory polycythemia not yet developed
- **CVS exam**

a. RVH: Precordial bulge
b. RV type of apex(upturned apex)
c. Auscultation
  - Ejection systolic murmur in pulmonary area
  - Single S_2 (P_2 is soft & inaudible)
  - In severe TOF/TOF with pulmonary atresia= continuous murmur (due to collaterals)

- Severity of TOF: α Severity of Cyanosis

$$:\alpha \frac{1}{\text{Intensity \& duration of murmur}}$$

- **Complications of TOF**
  a. Cerebral thrombosis: due to polycythemia & dehydration (in <2 yrs)
  b. Cerebral abscess: in > 2 yrs
  c. Bacterial endocarditis
- **Investigations**
  1. CxR: Boot Shaped Heart (or) 'Cor En Sabot' Appearance

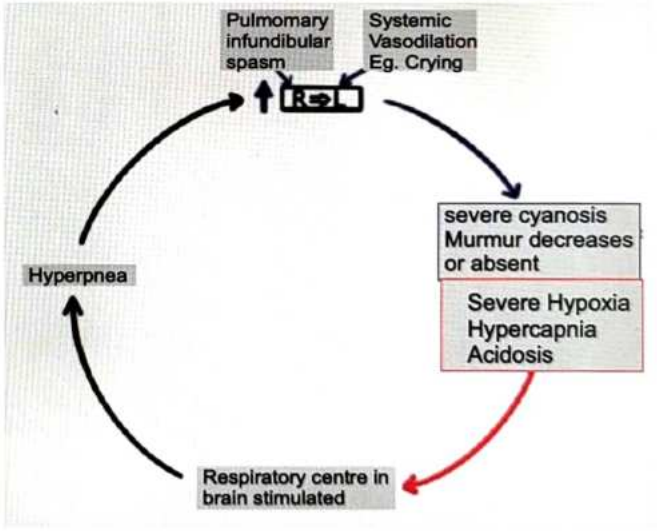
+

Pulmonary Oligemia

  2. ECG: RVH pattern
  3. 2D ECHO with doppler is confirmatory of TOF

CYANOTIC SPELL OR TET SPELL

Pathophysiology



Treatment of cyanotic spell

1. Moist O_2 inhalation (decreases pulmonary vascular resistance)
2. Inj. Sodium Bicarbonate (to neutralize acidosis)
3. Morphine
4. Ketamine (increases systemic vascular resistance)
5. Alpha agonists (Phenylephrine)

6. Beta blockers (Propanolol): decreases pulmonary infundibular spasm, used as prophylactic medicine
7. Squatting or knee chest position helps aborting cyanotic spell: increases systemic vascular resistance, decreases venous return to right side of heart
8. PRBCs transfusion

Surgical Treatment of TOF

- Definitive (corrective) Sx → VSD closure + Repair of Pulmonary stenosis
- Shunt (palliative) Sx → Connection b/w pulmonary artery & aorta or its branch
  - **B** - **B**lalock Taussig shunt: **S** - **S**ubclavian artery
  - **W** - **W**aterston's Shunt: **A** - **A**scending Aorta
  - **P** - **P**ott's Shunt: **D** - **D**escending Aorta

How to remember

- BaSWahAPahucha Do

CLINICAL QUESTIONS

Q. 10 years old male child presents to the hospital with complaints of cyanosis, fatigue, and dyspnea. On further examination, the patient presents with equal cyanosis in both fingers and toes. The patient also presents with features suggestive of pulmonary artery hypertension. The patient's past history reveals the presence of frequent chest infections in childhood. You made a provisional diagnosis of Eisenmenger syndrome. In which of the following conditions reversal of shunt is not possible?

A. ASD
B. VSD
C. TOF
D. PDA

Answer: C

Solution

The above scenario describes **the Eisenmenger syndrome**

- Pulmonary artery hypertension + reversal of shunt

Reversal of shunt or **Eisenmenger syndrome:**

- In this condition, the blood is shunted from right to left as a result of the development of pulmonary vascular disease i.e. left to right shunts are converted to right-to-left shunts as pulmonary vascular resistance exceeds systemic vascular resistance.
- It is seen in:
  - VSD
  - ASD
  - AV canal defect
  - PDA
  - Any other communication between the aorta and pulmonary artery

Reference: Ghai 9/e pg-425-426

Q. A bothersome mother brought his child who turns blue while crying associated with the development of breathlessness and gives the typical history of his child frequently uses which of the following position?

A. Supine
B. Prone
C. Squatting
D. Leaning forwards

Answer: C

Solution

- TOF is the commonest congenital disease in which squatting/ sitting posture is noted.
- The mother describes the anoxic and Tet spells associated with TOF

Squatting helps by:

- Increasing systemic vascular resistance, so that more blood goes to the lungs for oxygenation
- It increases pressure on the left side of the heart, decreasing the right to left shunt thus decreasing the amount of deoxygenated blood entering the systemic circulation.
- Hence, patients of TOF assume a sitting posture (**squatting**) as soon as they get dyspneic.

Reference: Ghai 9/e, pg- 418

48 OTHER CONGENITAL HEART DISEASES

TRUNCUS ARTERIOSUS

00:01:10

- Single common trunk from which pulmonary artery & aorta arise
- Rt sided aortic arch is commonly a/w truncus arteriosus
- 22 q deletion commonly associated [CATCH 22]
  a. Conotruncal abnormalities
  b. Abnormal facies
  c. Thymic hyperplasia
  d. Cleft palate
  e. Hypocalcemia

TAPVC / TAPVR [TOTAL ANOMALOUS PULMONARY VENOUS CONNECTION / RETURN]

00:04:35

- Basic defect: Pulmonary veins instead of draining into the left atrium, drain either directly or indirectly into right atrium
- 3 types

	Supra cardiac	Cardiac	Infra cardiac
Pulmonary Veins drain into	• SVC • Lt. Innominate vein • MC type	• Rt. Atrium coronary sinus	• IVC • Hepatic veins • Portal • Always obstructive

- Obstructed TAPVC presents with heart failure even in 1st wk of age

Timing of heart failure in CHDs

00:10:40

Refer Table 48.1

- **CXR in TAPVC**

a. Supra-cardiac TAPVC: 'Figure of 8' or 'snow man' appearance
b. Obstructed TAPVC : Ground glass haziness of lungs

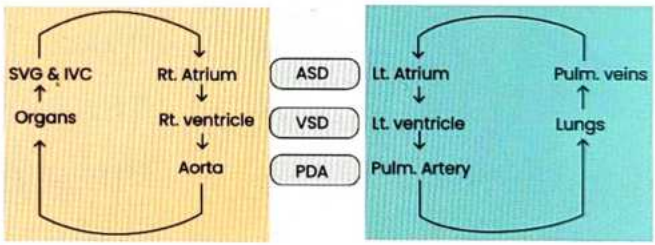
Previous Year's Questions

Q. Pulmonary plethora in a child with cyanosis. is seen in? (NEET Jan 2020)
A. TOF
B. TAPVC
C. Coarctation of aorta
D. Tricuspid atresia

TGA / TGV [TRANSPOSITION OF GREAT ARTERIES / VESSELS]

00:17:14

- Basic defect: Pulmonary artery instead of arising from Rt. Ventricle, arise from left ventricle and aorta instead of arising from Lt ventricle, arises from Rt ventricle
- Parallel Circulation (D – TGA)

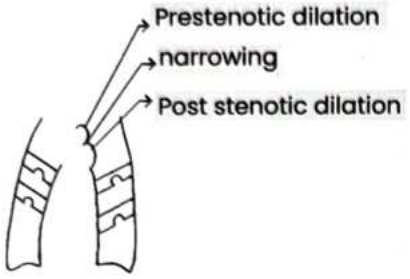


- L – TGA or corrected TGA: Usually comes to notice due to other associated heart defects
- CXR: "Egg on side" appearance
- MC congenital cyanotic heart disease presenting in neonatal period of early infancy TGA
- **Treatment**
  - PGE_1 analogue [Alprostadil] → Keeps ductus arteriosus open
  - Balloon atrial septostomy / Rashkind procedure: Emergency procedure
  - Arterial switch operation / Jatene's repair: Definitive surgery

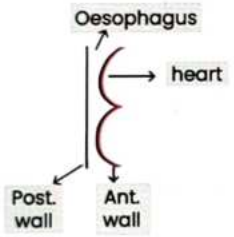
COARCTATION OF AORTA

00:30:46

- Juxta ductal part of aorta is mostly involved
- Medial wall of aorta is usually spared
- Clinical presentation
  - Severe coarctation: Heart failure in neonate with B/L feeble or impalpable femoral pulses
  - Hypertension in later life
  - Milder disease: intermittent claudication of lower limbs



- CXR: Figure of 3 appearance and Notching of inferior margin of 3rd – 9th ribs usually seen >3 years age
- Contrast Esophagogram and Barium Swallow: E sign



- **Treatment**
  - Balloon angioplasty
  - Anti hypertensives for hypertension

Previous Year's Questions

Q. A 6 yr old child presents with hypertension. On examination, lower limb pulse was feeble, upper limb pulse was normal. On chest x-ray, notching is seen. What is the probable diagnosis?

A. ASD
B. Bicuspid aortic valve
C. PDA
D. Coarctation of aorta

HLHS [HYPOPLASTIC LEFT HEART SYNDROME]

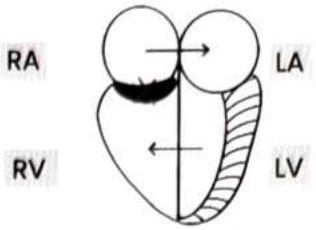
00:39:53

- MC congenital heart disease causing mortality in 1st wk of life since LV is poorly developed.

TRICUSPID ATRESIA

00:41:40

- Congenital cyanotic heart disease with left axis deviation on ECG → Tricuspid atresia



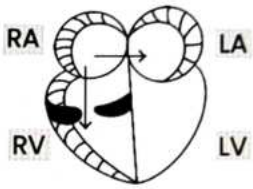
Tricuspid atresia

EBSTEIN ANOMALY

00:43:51

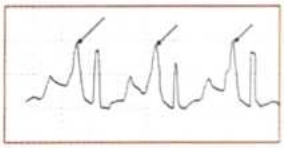
- Pathophysiology

Downward displacement of tricuspid valve
↓
Atrialization of right ventricle
+
Functionally abnormal tricuspid valve



- Huge cardiomegaly seen, especially Rt atrium [RA, LA, RV also involved]
- CXR: Box shaped heart
- ECG: Himalayan P waves

Box shaped heart



Himalayan P waves

Table 48.1

1st week	1-4 weeks	> 1 month

• Ductus dependent Systemic circulation
  ○ Severe coarctation of aorta
  ○ Interrupted aortic Arch
  ○ HLHS
	• PDA in preterms	• PDA in terms

• Obstructive TAPVC	• VSD with coarctation	• VSD
• TGA with intact obstructive • Ventricular septum	• Truncus arteriosus	• Non TAPVC
• Ebstein anomaly cushion	• TGA with VSD	• Endocardial Defects

CLINICAL QUESTIONS

Q. 5 years old boy came to the hospital with the development of dyspnea on running associated with intermittent claudication of the lower limbs. Further examination reveals weak femoral pulses and strong brachial pulses. Radiography reveals the presence classic "Figure of 3" appearance. Which of the following is most commonly associated with this conditon?

A. ASD
B. PDA
C. Bicuspid aortic valve
D. VSD

Answer: C

Solution

COARCTATION OF AORTA

- Sharp indentation involving anterior, lateral & posterior wall of aorta.
- Medial wall - spared
- MC associated with **bicuspid aortic valve**

Clinical presentation

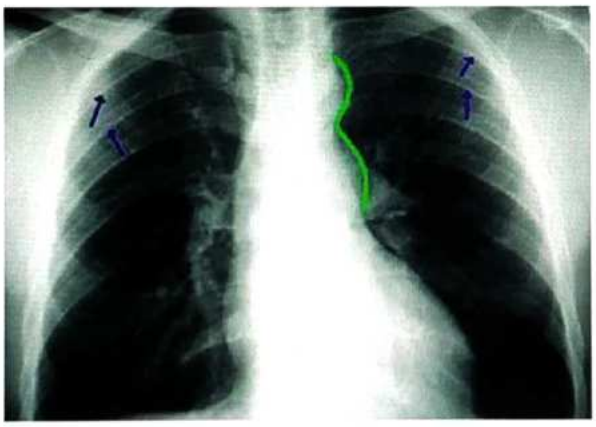
- Severe coarctation ??' Heart failure in neonate with B/L feeble or impalpable femoral pulses
- Hypertension
- Milder disease: intermittent claudication of lower limbs

CXR: Figure of 3 & Notching of inferior margin of 3rd ??" 9th ribs usually seen >3 years age

CONTRAST ESOPHAGOGRAM AND BARIUM SWALLOW: E sign

TREATMENT:

- Balloon angioplasty
- Antihypertensives for hypertension



Reference: Ghai 9/e p 428-429

Q. A 5-year-old girl always had to wear warm socks even in summer season. On physical examination, it was noticed that she had high blood pressure and her femoral pulse was weak as compared to radial and carotid pulse, a chest radiography showed 'figure of 3' appearance & notching of inferior margin of ribs. This was due to?

A. Femoral artery thrombosis
B. Coarctation of aorta
C. Raynaud's disease
D. Takayasu arteritis

Answer: B

Solution

??' **Hypertension + Weak femoral pulses + 'figure of 3' appearance & notching of inferior rib margins ??'** point towards diagnosis of **Coarctation of aorta.**

Coarctation of aorta:

- Sharp indentation involving anterior, lateral & posterior wall of aorta; Medial wall is usually spared
- Juxta ductal part of aorta is mostly involved
- Medial wall of aorta is usually spared
- C/F:
  - Severe Coarctation??' Heart failure in neonates with B/L feeble or impalpable femoral pulses
  - Hypertension
  - Milder disease- intermittent claudication of lower limbs
- CXR:
  - Figure of '3' appearance
  - Notching of inferior margin of 3rd to 9th ribs usually seen >3 years age
- Contrast esophagogram & barium swallow: E sign
- Rx:
  - Balloon angioplasty
  - Anti hypertensives for hypertension

Other options:

Raynaud disease:

- When Raynaud Phenomenon is independent of an underlying rheumatic disease
- Raynaud Phenomenon refers to the classic triphasic sequence of blanching, cyanosis, and erythema of the digits induced by cold exposure and/or emotional stress.

Takayasu arteritis: also known as "pulseless disease"

- It is a chronic large vessel vasculitis of unknown etiology
- Predominantly involves the aorta and its major branches
- Age of onset: Between 10 and 40 years
- Preferentially affects females
- C/F's: Hypertension, headache, diminished pulses, asymmetric blood pressures, claudication, Raynaud phenomenon, renal failure, and symptoms of pulmonary or cardiac ischemia.

Femoral artery Thrombosis:

- Usually seen after an intervention like cardiac catheterisation
- C/F's: Pulselessness, cold temperature, pallor, pain and impaired movement of the lower extremity.

Reference: Ghai 9/e pg- 428

49 RHEUMATIC FEVER AND RHEUMATIC HEART DISEASE

- Mc acquired heart disease in children in developing countries: RHD
- ARF/RHD is strongly associated with antecedent group A streptococcal pharyngitis (with strains M1,3,5,6,18,29)
- Pathogenesis: immune mediated

Modified Jone's criteria (2015) 00:03:15

Low risk	Moderate to high risk
• Incidence= <2/lakh school going children	• Incidence= >2/lakh school going children
• Rhd prevalence= <1/1000	• Rhd prevalence= >1/1000

Major criteria

1. Carditis (clinical or subclinical):50-60%
2. Arthritis(low risk population: polyarthritis, moderate to high risk population: polyarthritis, monoarthritis, polyarthralgia): 75%
3. Chorea (syndenham's chorea): 10-15%
4. Erythema marginatum: 1%
5. Subcutaneous nodules: <1%

Minor criteria

1. Polyarthralgia (low risk population), monoarthralgia (moderate to high risk population)
2. Fever
3. Increased ESR/CRP
4. Prolonged PR interval

Essential criteria: Evidence of antecedent group A streptococcal infection (increased or rising ASO titres)

Modified Jone's criteria

- Initial episode of RF = 2 major or 1 major + 2minor criteria
- Recurrence of RF = 2 major or 1 major+2 minor or 3 minor

Important Information

Mc manifestation of RF: arthritis f/b carditis (mitral valve f/b aortic valve)

Treatment of ARF 00:15:01

- A course of antibiotics: 10 days of oral amoxicillin or penicillin or single dose of IM benzathine penicillin (azithromycin in penicillin allergy)
- Aspirin: 50-70 mg/kg/day initially
- Corticosteroids: carditis + CCF/ cardiomegaly
- Best rest: carditis

Primary prophylaxis 00:17:17

- Any streptococcal pharyngitis: appropriate antibiotics should be started within 9 days of onset of illness to prevent RHD (poverty/overcrowding: risk factors for ARF/RHD)

Secondary prophylaxis

- inj. Benzathine penicillin IM 6 lakh IU in children </= 27 kg
- Inj. Benzathine penicillin IM 1.2 million IU in 27 kg every 3-4 weeks
- Till when secondary prophylaxis
  - Without carditis: 5 yr or till 21 yr age, whichever is later
  - With carditis but without residual heart disease: next 10 yr or till 21 yr, whichever is later
  - With residual heart disease: next 10 yr or 40 yr of age, whichever is later

CLINICAL QUESTIONS

Q. 10 years old girl presents to the hospital with complaints of fever associated with severe throat pain. To prevent acute rheumatic fever, acute pharyngitis due to group A streptococci should be treated with antibiotics within?

A. 7 days of illness
B. 8 days of illness
C. 9 days of illness
D. 10 days of illness

Answer: C

Solution

- **Antibiotic** therapy for patients with **GAS pharyngitis** can
  - **Prevents acute rheumatic fever**
  - **Shortens** the clinical course of the illness
  - **Reduce transmission** of the infection to others &
  - **Prevent suppurative complications.**
- All these can be done when therapy is instituted within **9 days of onset of symptoms** and continued for the full course.

Reference: Nelson's 20/e p 2269-2271

Q. 10 years old girl presents to the hospital with complaints of fever associated with pharyngitis. Electrocardiogram reveals the presence of a prolonged PR interval. In view of acute rheumatic fever, the patient was started with Penicillin. The patient showed allergic symptoms for penicillin. Which of the following is the drug of choice for rheumatic fever prophylaxis in penicillin-allergic patients?

A. Erythromycin
B. Clindamycin
C. Vancomycin
D. Gentamycin

Answer: A

Solution

- For a patient who is allergic to both penicillin and sulphonamides, a **macrolide (erythromycin or clarithromycin, or azithromycin)** may be used.
- Recommendations of American heart association for the duration of secondary prophylaxis

Category: Rheumatic fever	Duration of secondary prophylaxis
Without carditis	5 years or until 21 years of age, whichever is longer
With carditis but without residual heart disease	10 years or until 21 years, whichever is longer
With carditis and residual heart disease	10 years or until 40 years age, whichever is longer, sometimes lifelong

Reference: Nelson's 20/e p 2269-2271, Ghai 8/e p 433-443

50 IMAGE BASED QUESTIONS

Q. A child with VSD develops the following findings.There is no history of fever. What is the most probable cause?

Ans. Eisenmenger Syndrome (reversal of shunt)

Q. A 6 year child presented with hypertension and his chest x-ray shows the following. What could be the cause?

Ans. Coarctation of Aorta

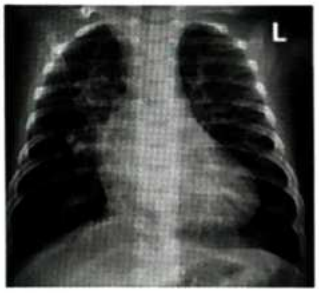
Q. The following finding suggests?

Ans. Tetralogy of Fallot

Q. suggest the diagnosis.

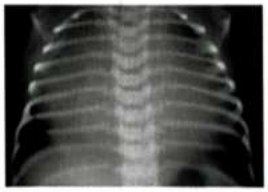
Ans. TAPVC (supracardiac)

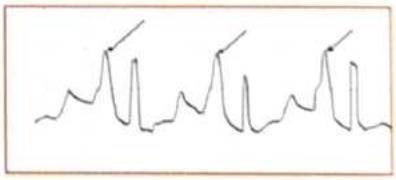
Q. what is the diagnosis?



Ans. TGA (Transposition of great arteries)

Q. What is the diagnosis from the following x-ray and ECG?





Ans. Ebstein's anomaly

LEARNING OBJECTIVES

UNIT 14 PEDIATRIC HEMATOLOGY AND ONCOLOGY

- Imp. Hematological disorders
  - Normal erythropoiesis
  - Anemias in children: IDA, megaloblastic, thalassemia, sickle cell anemia
  - Aplastic anemia

- Imp. Bleeding disorders
  - ITP
  - Neonatal alloimmune thrombocytopenia
  - VKDB
  - Hemophilias
  - Some factor deficiencies

- Hematological malignancies in children
  - Acute leukemias in detail
  - Hodgkin disease
  - Langerhans cell histiocytosis

- Tumors in children
  - Retinoblastoma
  - Neuroblastoma
  - Wilms tumor
  - Sacro coccygeal tumor
  - Brain tumors

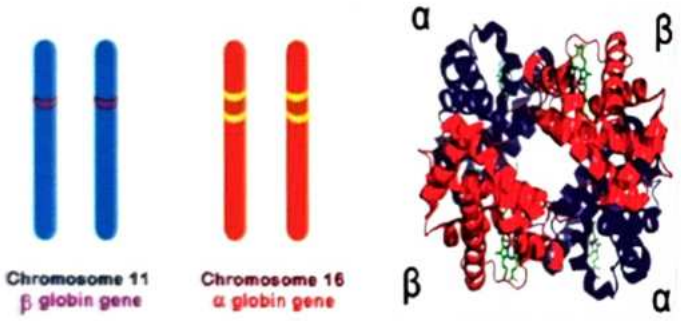
51 IMPORTANT HEMATOLOGICAL DISORDERS IN CHILDREN

NORMAL ERYTHROPOIESIS

00:00:16

- Normal human haemoglobins

	Hemoglobin	Structural formula
Embryonic	Hb-Gower 1	$\zeta_2\varepsilon_2$
	HB-Gower 2	$\alpha_2\varepsilon_2$
	Hb- Portland	$\zeta_2\gamma_2$
Fetal	Hb-F	$\alpha_2\gamma_2$ (0.5-1%)
Adult	Hb-A	$\alpha_2\beta_2$ (97%)
	Hb- A_2	$\alpha_2\delta_2$ (1.5-3.2%)



Hemoglobin

MAJOR SITES OF HEMATOPOIESIS

00:03:12

- Yolk sac: Starts from 3rd week till 10-12th week
- Liver: Starts at 6-8th week, ceases by 2nd trimester
- Bone marrow: Starts from 2nd trimester onwards

Important Information

Normal life span of RBC

- Older children & adults: 120 days
- Term neonate: 90 days
- Preterm neonate: 60 days

ANEMIAS IN CHILDREN

00:05:18

- **WHO definition**
  - Children 6 months – 5 years: Hb < 11 g/dl
  - Children 6-14 years: Hb < 12 g/dl
- Approach to anemia in children

Refer Flow Chart 51.1

IRON DEFICIENCY ANEMIA

00:10:08

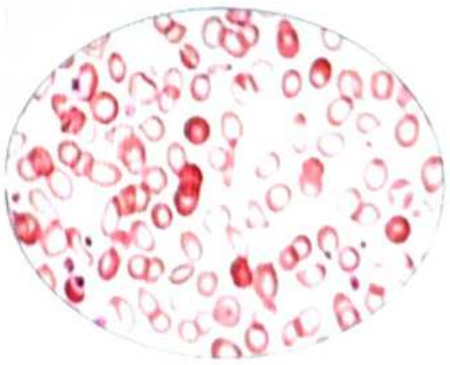
- Mc cause of nutritional disorder in the world
- MC cause of anemia in the world

Etiology

- Decreased iron intake
  - Inadequate diet
- Impaired absorption: Celiac disease
- Increased iron loss
  - Gastrointestinal bleeding
  - Inflammatory bowel disease
- Increased requirements
  - infancy, puberty
- Inadequate presentation to erythroid precursors
  - Atransferrinemia

Clinical Features

- Pallor: generalised weakness, lethargy
- Smooth and shiny tongue
- Pica
- Koilonychia
- PS: Microcytic, Hypochromic Anaemia, anisocytosis, target cells, pencil cells



Important Information

microcytic, hypochromic anemia also in:

- Thalassemia
- Anemia of chronic disease eg., RA, osteomyelitis, papillary necrosis
- Lead poisoning
- Sideroblastic anemia

Refer Table 51.1

Important Information

$$\text{Mentzer Index} = \frac{\text{MCV (FL)}}{\text{RBC count } (\frac{\text{million}}{\text{ml}})}$$

Treatment of IDA 00:20:16

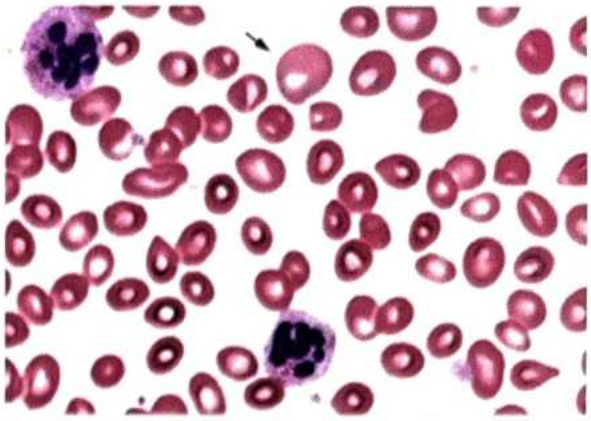
- 3-6 mg/kg/ day of elemental iron
- Maximum dose: 200mg of elemental Iron daily
- Only 10% of oral dose gets absorbed
- For IV correction, total amount of Iron needed
  = (body weight [kg]× [15 - patient's Hb] ×2.3) + 500mg

Response to treatment in iron deficiency anemia 00:22:32

Time after Iron administration	Response
12-24 hours	Decreased irritability, increased appetite
48-72 hours	Reticulocytosis appears, peaks at 5-7 days post treatment
4-30 days	Increase in Hb level (best measure)
1-3 months	Repletion of stores

MEGALOBLASTIC ANAEMIA 00:25:04

- Due to Vit B12 or folic acid deficiency
- On Peripheral smear: Macro ovalocytes, Hyper segmented neutrophils (>5 lobes in 5% neutrophils)
- **Treatment:** Vitamin B12 and Folic acid



BETA-THALASSEMIA 00:26:35

- Defect: Decreased production of Beta globin chains.
- Common Mutations in India
  - IVS 1-5 G → C
  - IVS 1-1 G → T
  - Codon 41/42
  - Codon 819
  - 619 by deletion

- **Classification**
  - **Thalassemia trait/ minor:** Heterozygous state, Mild Anemia ($HbA_2 \geq 3.5\%$, HbF is normal)
  - **Thalassemia intermediate** (⁰/⁻): Moderate anaemia, Hepatosplenomegaly: HbF elevated
  - **Thalassemia major** (⁰/⁰): severe anaemia, hemolytic facies: HbF markedly elevated regular transfusions requirement

Clinical features

- Haemolytic Facies
  - Frontal prominence
  - depressed bridge of nose
  - maxillary prominence
- Hepatosplenomegaly (d/t extramedullary hematopoiesis)

Investigation

- Lat. X Ray skull: 'Hair on End' or 'Crew Cut appearance'

- Hemolytic anemia
  - Low Hb, low MCV, low MCH(thalassemia major)
  - Increased LDH
  - Increased unconjugated bilirubin
- PS: microcytic, hypochromic anemia, target cells, Howel jolly bodies, poikilocytosis
- Osmolar fragility: decreased (NESTROFT- Naked Eye Single Tube Red Cell Osmotic Fragility Test)
- Coombs test -ve (+ve in immune hemolytic anemias)
- Hb HPLC(high performance liquid chromatography) or Hb electrophoresis:
  - Hb A decreased
  - Hb A2 increased
  - HbF increased

  } beta thalasemia major
- Definitive diagnosis: globin gene mutation- helps in prenatal diagnosis in next pregnancy

Treatment of Thalassemia 00:37:47

- **Repeated Blood Transfusions**: To maintain pretransfusion Hb level between 9.5-10.5 g/dL
- The only curative treatment for thalassemia major: Hematopoietic stem cell transplantation (HSCT)
- Iron Chelation Therapy: Usually started when serum ferritin >1000 ng/ml
  - Deferoxamine: Parenterally (IV or SC)
    → Effective in reverting hepatic & cardiac iron deposition.
  - Deferiprone: 1st oral chelator.
    → Adverse effects ▮ Agranulocytosis, GI side effects, arthritis
  - Deferasirox: Oral drug, Effective in decreasing cardiac iron burden & lowering serum ferritin.

Complications of thalassemia and its therapy 00:41:54

- Endocrine: Osteoporosis, Short stature, delayed puberty, Hypothyroidism, Hypogonadism, D.M
- Cardiac: Heart failure, pericardial effusion, DCM
- GI: Transaminitis
- Other- Infections, allergies

ALPHA THALASSEMIA

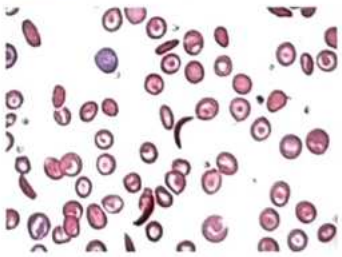
- Normal $\alpha\ \alpha/\alpha\alpha$
- Alpha trait $-\alpha/\alpha\alpha$
- Alpha thalassemia $--/\alpha\alpha$
- Non immune hydrops $--/-\alpha$
- Free beta and gamma chains: $\beta 4$ & $\lambda 4$ (tetramers) – precipitate in RBCs and hemolysis occurs

SICKLE CELL ANEMIA 00:45:50

- MC Structural Hemoglobinopathy
- Point mutation in 6th codon of β-globin gene so there is replacement of glutamate with valine
- Production of Hb with abnormal physiochemical properties that promotes polymerization of deoxygenated Hb
- **Heterozygous Trait**: sickle cell trait –protects against falciparum
- **Homozygous Trait**: sickle cell disease
- **Pathophysiology**

  On Deoxygenation, HbS forms long polymers
  ↓
  RBC membrane damage
  Microvascular obstruction leading to ischemia & tissue damage.
  Hemolysis in Reticuloendothelial system

- **Clinical Features**
  - Usually presents after 6 months of age
  - Anemia: pallor, generalized weakness
  - CNS: stroke
  - Retinopathy
  - ,Hand foot syndrome (dactylitis of hands & foot)
  - Priapism (in 45% of affected male) & erectile dysfunction
  - Auto splenectomy due to splenic infarcts: predisposes to infection by encapsulated organisms
  - Renal papillary necrosis



Important Information

- Infection is M/C cause of death in children < 3 yrs of age

Important Information

Crises in sickle cell disease

- vaso occlusive crisis:painful
- aplastic crisis: parvovirus B19
- hemolytic crisis
- splenic sequestration
- acute chest syndrome

- **Diagnosis**
  - PS: evidence of hemolysis, sickle cells, Howel Jolly bodies
  - (SICKLING TEST: mixing a blood sample with metabisulfite or dithionate induces sickling of RBCs, if HbS is present)
  - Spleen biopsy: Gamma Gandy bodies
  - Hb Electrophoresis to detect HbS peak
  - Confirmatory test: genetic defect checked
- **Treatment**
  - Maintain hydration
  - Avoid infections & do immunisation
  - Acute painful crisis: analgesia
  - blood transfusion
  - Hydroxyurea for patients with severe symptoms (increases HbF levels)
  - Bone marrow transplantation
  - gene therapy

Important Information

- HbD: in punjabi/sindhis
- HbE: in Bengal/ NE states

Previous Year's Questions

Q. A boy after playing football complaining and abdominal pain. He also had a history of hand swelling in past. On USG. he has shrunken spleen. What is the likely diagnosis of this patient? (NEET Jan 2020)

A. Sickle cell anemia
B. IDA
C. Acute pancreatitis
D. Intermittent porphyria

FANCONI ANEMIA

01:02:43

- AR inheritance
- Abnormal chromosomal fragility (demonstrated using Diepoxybutane or Mitomycin C)
- **Clinical Features**
  - Most common Hyperpigmentation, café au lait spots
  - Short stature
  - Absent radius, hypoplastic thumb.
  - Facial dysmorphism: Microcephaly, small eyes, epicanthic folds, abnormal ears.
  - Renal/ CNS/GIT malformations
- **Complications**: Increased risk of tumors like squamous cell Carcinoma of Head/ Neck/Esophagus.
- **Treatment**
  - Transfusions
  - HSCT (definitive treatment)

APLASTIC ANEMIA

01:05:24

- Inherited/acquired condition with pancytopenia with hypo/acellular bone marrow
- **Clinical features**
  - pancytopenia
    - → Anemia:pallor, easy fatiguability,
    - → Thrombocytopenia: bleeding manifestations
    - → Leukopenia: fever, recurrent infections
  - No lymphadenopathy
  - No hepatosplenomegaly
- **Diagnosis**
  - CBC: pancytopenia
  - PS: normocytic, macrocytic, decreased platelets, decreased WBCs
  - Bone marrow: fat globules
- **Treatment**
  - Treat the cause
  - Steriods
  - Immunosuppresants
  - ,Antithymocyte globulin
  - Transfusion
  - Hsct

Flow Chart 51.1

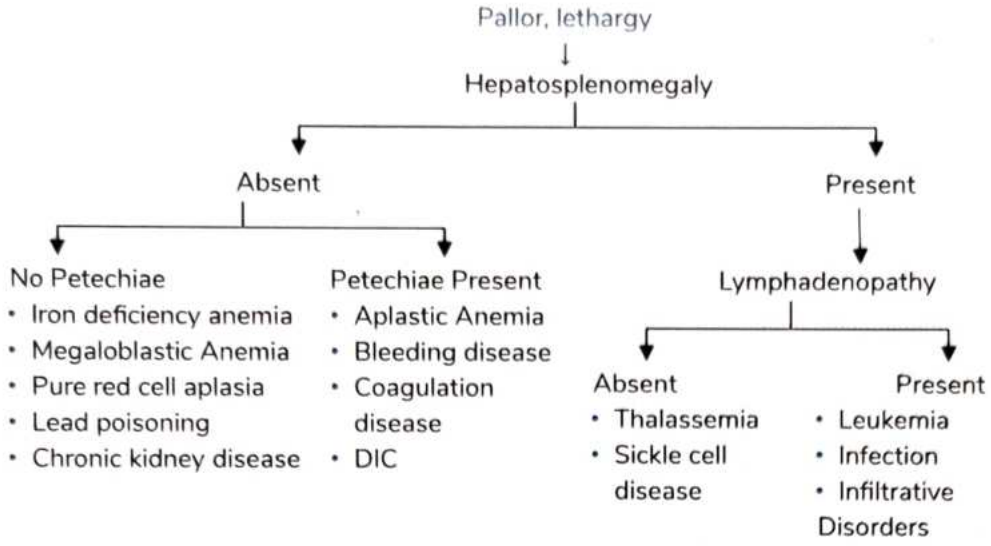


Table 51.1

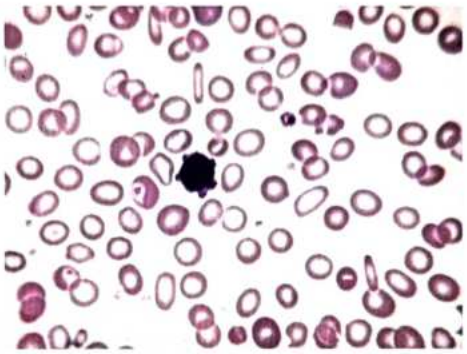
00:16:54

D/D of microcytic, hypochromic anemia	IDA	B Thalassemia minor / trait	Anaemia of Chronic disease
RDW	Increased	Normal	Normal/Increased
S. iron	Decreased	Normal/Increased	Decreased
S. ferritin	Decreased	Normal/Increased	Increased
TIBC	Increased	Normal	Decreased
Mentzer Index	>14	<13	

CLINICAL QUESTIONS

Q. A 6-year-old child presents with anemia. His peripheral smear shows the following picture. All of the following are differential diagnoses for his condition except?



A. Anemia of chronic disease
B. Lead poisoning
C. Aplastic anemia
D. Iron deficiency anemia

Answer: C

Solution

- The given peripheral smear is showing **Microcytic hypochromic anemia**
- **CONDITIONS IN WHICH MICROCYTIC HYPOCHROMIC ANEMIA IS SEEN ARE:**
  - Anemia of chronic diseases
  - Lead poisoning
  - Thalassemia
  - Iron deficiency anemia
  - Sideroblastic anemia
- Hence, all the above conditions are differential diagnosis of microcytic hypochromic anemia
- In Aplastic anemia, Normocytic Normochromic Anemia is seen. So, not a DD of this condition

Reference: Ghai 9th edition, pg-333

Q. In which condition, the following finding in tongue is commonly seen?

A. Sickle cell anemia
B. AML
C. Iron defciency anemia
D. MDS

Answer: C

Solution

- **Smooth & shiny tongue (glossitis) is seen in severe iron deficiency anemia**

IRON DEFICIENCY ANEMIA:

- MC cause of nutritional disorder in the world
- MC cause of anemia in the world

CLINICAL FEATURES:

- Smooth tongue
- Pallor, fatiguability
- Pica
- koilonychia → spooning of nails

Peripheral Smear: Microcytic Hypochromic Anemia ,anisocytosis, target cells & pencil cells are seen.
MENTZER INDEX: >14

52 HEMATOLOGICAL MALIGNANCIES IN CHILDREN

- ALL
- AML
- Hodgkin Disease
- LCH

ACUTE LEUKEMIA

00:00:33

- Most common malignancy in children
- In children ALL > AML
- B-ALL > T-ALL
- Superior mediastinal syndrome is MC in adolescent boys with T-ALL.
- Genetic syndromes predisposing to development of acute leukemias in children
  - **D** - **D**own syndrome
  - **D** - **D**iamond Blackfan syndrome
  - **K** - **K**ostmann syndrome
  - **F** - **F**anconi anemia
  - **N** - **N**F1
  - **B** - **B**loom syndrome
  - **S** - **S**hwachman diamond syndrome
  - **L** - **Li** fraumeni syndrome
  - **A** - **A**taxia telegiectasia
  - **P** - **P**NH (paroxysmal nocturnal hemoglobinuria)

How to remember

- Daughter Ke Father Ne Boy Ko SLAP Kia

ALL (ACUTE LYMPHOBLASTIC LEUKEMIA) CLASSIFICATION

00:04:53

A. FAB Classification (previously used)

- Morphological classification
  - L1: small cells with min. cytoplasm
  - L2: small and large cells with predominant nucleoli and variable cytoplasm
  - L3: large cells with vacuolated cytoplasm

B. WHO classification of ALL (used now)

1. ALL with recurrent cytogenetic aberrations

Good prognosis	poor prognosis
• t(12;21)	• t(5;14)
• Hyperdiploidy	• t(9;22)
• (trisomy 4,10,17)	• hypodiploidy

2. ALL NOS (not otherwise specified)

- L1
- L2
- L3

AML (acute myeloid leukemia)

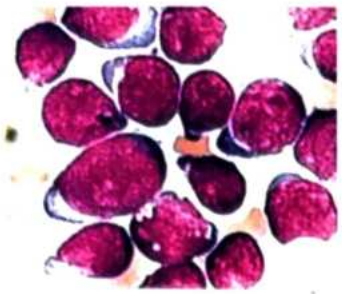
WHO Classification

1. AML with recurrent cytogenetic aberrations

Good prognosis	Poor prognosis
t(8;21) M2	t(1;22)
t(15;17) M3	t(6;9)
inv 16 M4	FLT 3 mutation
CEBPA mutation	
NPM-1 mutation	

2. AML with myelodysplastic changes: poor prognosis
3. AML- therapy related- poor prognosis
4. AML in Down syndrome(M7)/GATA-1 mutation – good prognosis
5. AML-NOS : M0-M7 (FAB classification)

- M0 - Minimally differentiated cells
- M1 - Without maturation
- M2 - With maturation
- M3 - Acute promyelocytic leukemia
- M4 - Myelomonocytic
- M5 - Monocytic
- M6 - Erythroid leukemia
- M7 - Megakaryo Blastic leukemia



Clinical features

- Pancytopenia
  - Anemia: easy fatiguability, pallor
  - Thrombocytopenia: bleeding
  - Leukopenia: recurrent infections
- Initially non-specific features: anorexia, irritability, fever
- Severe bone/joint pains
- Organ involvement: lymphadenopathy, hepatosplenomegaly, testicular involvement, neurological features
- Respiratory distress: due to severe anemia or compression of airways by enlarged lymph nodes.

Clinical differentiation b/w AML and ALL

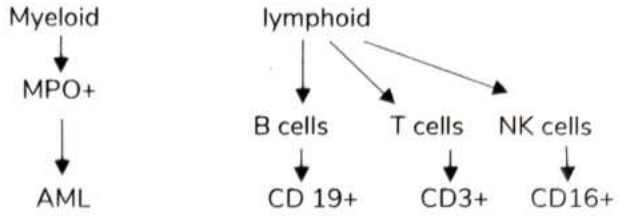
	ALL	AML
CNS infiltration	++	+
Testicular infiltration	++	+
mediastinal LN	++	+
Chloromas	-	++ (M2> M5)
gum hypertrophy	-	++ (M5)
DIC	-	++ (M3 variety)

Diagnosis

1. ≥ 20% blasts in peripheral blood or bone marrow examination is essential to diagnose ALL & AML
- Except
  - t(8;21)
  - t(15;17)
  - inv 16

  } Irrespective of the % of blasts, it is AML.
2. Cytochemistry
- ALL: PAS+
- AML: MPO & SBB (SUDAN BLACK B-STAIN)
- Auer rods seen

3. Immunophenotyping: blasts (CD 34+)



Treatment of ALL: for 2.5 yrs to 3 yrs

A. Induction
- **V - V**incristine
- **P - P**rednisolone
- **L - L**-asparaginase
- **A - A**nthracycline

B. CNS Prophylaxis
- Intrathecal chemotherapy eg MTX +/- cranial irradiation

C. Consolidation/ intensification
- **M - M**ethotrexate
- **C - C**yclophosphamide
- **L - L**- asparaginase
- **A - A**ra-C

D. Maintenance
- To prevent relapse
- Daily 6-MP & weekly MTX
- Given for long term

Treatment of AML

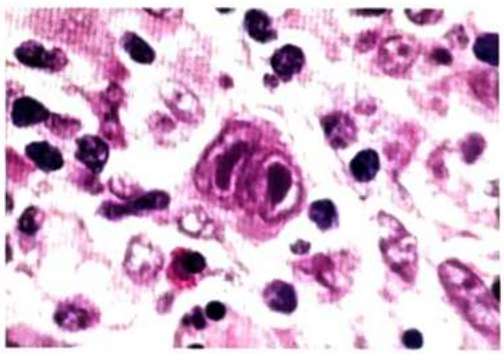
- Drugs used
  - Ara-C (cytosine arabinoside)
  - Anthracycline (doxorubicin)
  - Arsenic
  - ATRA (All Trans Retinoic Acid)

PROGNOSTIC MARKERS IN ALL 00:31:18

Refer Table 52.1

HODGKIN's DISEASE 00:36:02

- Clinical Features: Fever, lymphadenopathy, hepatosplenomegaly



Types	
Nodular	**Classical**
• Lymphocyte Predominant	• Lymphocyte rich • Lymphocyte depletion • Mixed cellularity • Nodular sclerosis

ANN ARBOR STAGING

I - Single LN or extra lymphatic site involved
II - 2 or more LN regions on same side of diaphragm involved
III - LN regions on both sides of diaphragm involved
IV - Diffuse or Disseminated disease ±LN involvement.

Treatment

- 'ABVD'
  - **A** - **A**driamycin (Doxorubicin)
  - **B** - **B**leomycin
  - **V** - **V**inblastine
  - **D** - **D**acarbazine

LANGERHANS CELL HISTIOCYTOSIS

00:40:02

- Due to excess proliferation of dendritic cells.
- Types

a. Eosinophilic granuloma: Localized disease & eosinophilia
b. Hand Schuller Christian disease: Lytic bone defects, DI, Exophthalmos
c. Letterer siwe disease: Multiple foci & organs involvement

- Clinical features
  - Localized → Osteolytic bone lesions (punched out lesions) → skull & mastoid involved → chronic ear discharge
  - Scalp: Seborrheic dermatitis
  - Pancytopenia: Increased extra medullary haematopoiesis → hepatosplenomegaly
  - Lung involvement: Pneumothorax
  - Pituitary involved: DI & GH deficiency
- Diagnosis
  - Biopsy: CD1a or S-100
  - EM: Tennis racket shaped Birbeck granules
- Treatment
  - Localized: Steroids, Radiation, Curettage
  - Multifocal: Vinblastine, Etoposide, Prednisolone

Punched out lesion
On skull

Birbeck granules
On Electron Microscopy

Previous Year's Questions

Q. Which of the following malignancy is seen in a male child with short stature, low IQ, murmur in pulmonary area and lymphedema?
(JIPMER May 2019)

A. Retinoblastoma
B. Hepatocellular carcinoma
C. Juvenile myelo-monocytic leukemia
D. Germ cell tumor

Table 52.1

Characteristic	Good	Bad
Age	2-9 years	≤ 1 years or ≥ 10 years
Race	Whites	Blacks
Gender	Females	Males
TLC	< 10,000/micro L	>2 Lac/micro L
FAB	L1	L3
WHO	t (12;21) Hyperploidy	t (5;14), t (9;22) Hypoploidy
Phenotypically	Early Pre-B-cells	Mature B cells, T cells
Remission	≤14 days	≥28 days
MRD (Minimal Residual disease)	< 0.01 %	>0.01%

CLINICAL QUESTIONS

Q. 4 months old baby presents to the hospital with severe pallor. Complete blood count revealed pancytopenia. With the suspicion of leukemia, you are planning to take bone marrow biopsy. Bone Marrow biopsy is done from which of the following site in this patient?

A. Tibia
B. Sternum
C. Posterior superior Iliac Spine
D. Iliac crest

Answer: A

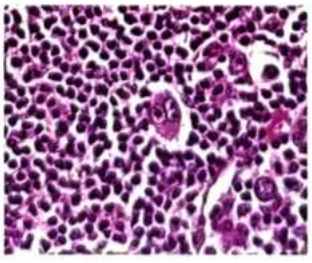
Solution

Age group	Site of Bone marrow sampling
Infants	Proximal tibia medial to tibial tuberosity
Children and Adults	Anterior or posterior iliac crest area

- Bone marrow biopsy is done to ascertain the cellularity and architecture of the marrow
- Indications for Bone marrow aspiration and biopsy:
  - Presence of pancytopenia, bicytopenia or leukocytosis to rule out lymphoreticular malignancy (ALL, AML,CML, Hodgkins or non-Hodgkins lymphoma, myelodysplasia, myelofibrosis)
  - Hypoplastic/aplastic anemia
  - Megaloblastic anemia
  - Sideroblastic anemia
  - Langerhans cell histiocytosis
  - Hemophagocytosis syndrome
  - Suspected metastasis (retinoblastoma, neuroblastoma)
  - Infiltrative storage diseases (Gaucher disease)
  - Infections involving bone marrow (kala-azar, TB)

Reference: Ghai 9/e pg -744

Q. A 10-year-child presented with bilateral cervical lymphadenopathy. Lymph node biopsy was performed, which showed cells as given in the figure.



Q. Which of the following is true regarding this condition?

A. Hodgkin lymphoma; EBV and embryo cell
B. Non Hodgkin lymphoma; HIV and Giant B cell
C. TB, Mycobacteria and tiny granuloma
D. Hodgkin lymphoma: EBV and Reed Sternberg cell

Answer: D

Solution

- The given image shows Reed Sternberg cell →seen in Hodgkin lymphoma and caused by EBV.

HODGKIN'S LYMPHOMA:

CLINICAL FEATURES: Fever, lymphadenopathy, hepatosplenomegaly.

TYPES:

- **Nodular Lymphocyte Predominance**
- **Classical ; include**
  - Lymphocyte rich
  - Lymphocyte depletion
  - Mixed cellularity
  - Nodular sclerosis

TREATMENT- [Mnemonic-' ABVD']

- A– Adriamycin (Doxorubicin)
- B – Bleomycin
- V – Vinblastine
- D – Dacarbazine

Reference: Nelson's 21 e, pg- 4835

53 TUMORS OF INFANCY & CHILDHOOD

RETINOBLASTOMA

00:00:32

- MC primary intra ocular tumor in children
- 40% are hereditary
- Caused by inactivation of RB1 gene on Chr 13q14
- MC presentation →Leukocoria (white eye reflex)
- Most common route of spread → Direct spread through optic nerve
- Most common secondary tumor following retinoblastoma
  - Osteosarcoma > Soft tissue sarcoma > Malignant Melanoma

Important Information

- Trilateral retinoblastoma • B/L retinoblastoma • tumor of pineal gland

NEUROBLASTOMA

00:03:25

- MC abdominal tumor of childhood
- 98% cases are sporadic
- Most frequently diagnosed tumor of infancy [<1yr of age]
- 90% Neuroblastomas produce catecholamines → vanillyl-mandellic acid [VMA] & homovanillic acid

- **Site of tumor**
  - Adrenal medulla [MC site]
  - Along the sympathetic chain, brain [cerebral neuroblastomas]

- **Clinical features**
  - Depends on tumor site & extent of disease.
    - → Localized disease: asymptomatic mass
    - → Catecholamine producing: Hypertension, secretory diarrhoea
    - → Extensive tumor: acute tumor lysis syndrome(ATLS), DIC
    - → Metastatic disease: bluish subcutaneous nodules, orbital proptosis, periorbital ecchymoses, bone pains.

Staging

Stage	Definition
1	Localized tumor with complete gross excision with lymph nodes negative
2A	Localized tumor with incomplete gross excision; with lymph nodes negative
2B	Localized tumor with ipsilateral lymph nodes positive for tumor
3	Unresectable tumor infiltrating across the midline, with or without regional lymph node involvement
4	Any primary tumor with dissemination to distant lymph nodes; bone; bone marrow, liver skin, and other organs
4S	Localized primary tumor (as defined for stage 1, 2A, or 2B), with dissemination limited to skin, liver, and bone marrow (limited to infants < 1 year of age)

Prognostic factors

	Favorable	Unfavorable
Stage	Stage 1, 2A, 2B, 4S	Stage 3, 4
Age	<18 months	> 18 months
DNA ploidy	Hyper-diploid	Near-diploid
N-MYC	Not amplified	Amplified
TRKA expression (Accha)	Present	Absent
TRKB expression (Bura)	Absent	Present

Treatment

- Combination of surgery, chemo and radio therapy depending on extent of involvement.

WILM'S TUMOR

00:13:01

- MC primary renal tumor of childhood
- Peak incidence → b/w 2-5 years
- MC initial clinical presentation for WT is incidental discovery of an asymptomatic abdominal mass by parents while bathing or clothing the child.
- Can present as
  - Synchronous: Both kidneys involved simultaneously
  - Metachronous: Kidneys affected one after the other

Congenital malformations with increased risk of wilms tumor

WAGR syndrome	Denys- Drash syndrome (90% risk, maximum risk)	Beckwith-Wiedemann syndrome (BWS)
Wilms tumor, Aniridia, Genital anomalies, mental Retardation	Gonadal dysgenesis (male pseudohermaphroditism), diffuse mesangial sclerosis, increased risk of gonadoblastoma	LFD, Organomegaly: macroglossia, hemihypertrophy, Omphalocele, Abnormal large cells in the adrenal cortex (adrenal cytomegaly) • Genomic imprinting is the causative mechanism

Staging

Stage I	Tumor confined to the kidney
Stage II	Tumor extends beyond the kidney, penetration of renal capsule ± invasion of renal sinus vessels
Stage III	Residual tumor present following surgery with regional lymph node metastasis.
Stage IV	Hematogenous metastasis (lung, live, bone, brain, etc.) or lymph node metastasis outside the abdominopelvic region
Stage V	Bilateral renal involvement by tumor

Treatment

- Surgery with or without chemo or radio therapy depending on the extent of the disease.

SACRO – COCCYGEAL TERATOMA (SCT)

00:20:42

- Teratoma arising from sacrococcygeal region.
- Arises from totipotent cells from node of Hensen, by 2nd to 3rd weeks of gestation.
- Mostly mixed solid / cystic.
- Classification

a. Benign [mature]: 60-70%
b. Malignant [immature]

- Complications

a. Ureter obstruction
b. Gastrointestinal obstruction
c. Anemia, tumor rupture
d. Compression of underlying nerves – incontinence
e. High output cardiac failure (from AV shunting)
f. Hydrops fetalis

- Treatment & Prognosis
  - Surgical excision ± chemotherapy

BRAIN TUMORS

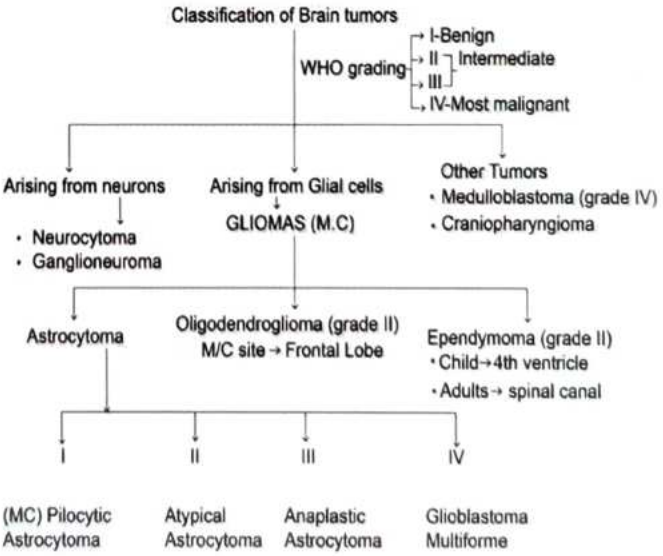
00:23:20

- MC solid malignancy of childhood
- 2nd MC malignancy in children (after leukemia)
- Risk factors:
  - cranial exposure to ionizing radiation
  - Hereditary syndromes

SYNDROMES ASSOCIATED WITH BRAIN TUMORS

00:25:10

Refer Table 53.1



Important Information

- MC CNS tumor in children: Pilocytic Astrocytoma
- Most aggressive CNS tumor in children → Medulloblastoma
- MC CNS tumor in children < 1 yr age: Choroid Plexus Tumor

Clinical features 00:40:02

Depend on tumor location, size, age of child

1. Supratentorial tumors (cortical tumors)
- Subtle behavioral changes
- Lateralized defects: focal motor weakness, seizures
- Premature hand preferences (due to weakness of the other side of body)
- Features of raised ICT: headache, vomiting, irritability, bulging fontanelles

2. Infratentorial tumors
- Gait disturbances
- Vision problems, diplopia, nystagmus
- Headache, vomiting, papilledema

3. Tumors of brainstem
- Gaze palsy, multiple CN palsies, UMN defects

4. Optic pathway tumors
- Decreased visual acuity, visual field defects

5. Suprasellar tumors
- Obesity
- Abnormal growth velocity
- Diabetes insipidus
- Hypothyroidism
- Delayed/ precocious puberty
- Galactorrhea

Some Syndromes 00:45:43

1. Diencephalic syndrome
- Failure to thrive
- Emaciation despite normal caloric intake
- Normal or happy affect
- Seen in infants/ young children
- With hypothalamic or pituitary tumors

2. Parinaud syndrome 00:47:12
- Seen in pineal region tumors
- Paresis of upward gaze
- Pseudo Argyll Robertson pupil (accommodation reflex present but not light reflex)
- Nystagmus to convergence
- Eyelid retraction

PILOCYTIC ASTROCYTOMA 00:49:12

- WHO grade I tumor
- Indolent clinical course
- MC location: Cerebellum > optic pathway
- On ME: Rosenthal fibers
- Radiology: contrast enhancing nodule within the wall of a cystic mass.
- Due to activation of MAPK pathway.
- Surgery is the primary treatment ± radiotherapy and/or chemotherapy.

MEDULLOBLASTOMA 00:52:01

- WHO grade IV tumor.
- Embryonal tumor or PNET (primitive neuroectodermal tumor)
- Always arises from cerebellum.
- MC genetic abnormality: 17p deletion.
- Median age: 5-7 years.
- HPE: small, round blue cells with Homer Wright Rosettes
- Neuroimaging: solid, homogenous contrast enhancing lesion in posterior fossa causing obstruction to 4th ventricle & hydrocephalus.
- Dissemination through the CSF is a common complication: giving rise to nodular masses at some distance away from the primary tumor called as "Drop Metastases"
- Chang staging used for it previously.
- Patient < 4 yr age & those with dissemination at diagnosis: Poor prognosis
- Treatment
  - Surgery + chemotherapy + radiotherapy (multimodal)
  - Radiotherapy is avoided in children < 3 yr age, to prevent severe neurologic sequelae & endocrine dysfunction.

CRANIOPHARYNGIOMA 00:59:43

- WHO Grade I Tumor
- Arises from suprasellar region
- 2 histologic types

a. Adamantinomatous (MC)
b. Papillary

- Clinical features
  - Endocrinologic: Growth failure, delayed sexual maturation
  - Vision: Decreased visual acuity & visual field defects
- Neuroimaging: solid tumor with cystic areas containing fluid ± calcifications
- Treatment
  - Surgery is the primary treatment.
  - No role of chemotherapy

Table 53.1

Syndrome	Tumors associated	Chromosome	Gene
Neurofibromatosis type 1 (autosomal dominant)	Optic gliomas, astrocytoma, neurofibromas, malignant peripheral nerve sheath tumors	17	NF1
Neurofibromatosis type 2 (autosomal dominant)	Vestibular schwannomas, meningioma, spinal cord ependymoma, spinal cord astrocytoma	22	NF2
Von – Hippel – Lindau (autosomal dominant)	Hemangioblastoma	3	VHL
Tuberous sclerosis (automal dominant)	Subependymal giant cell astrocytoma, cortical tubers	9 and 16	TSC1 TSC2
Li- Fraumeni (autosomal dominant)	Astrocytoma, primitive neuroectodermal tumor (PNET)	17	TP53
Cowden syndrome (autosomal dominant)	Dysplastic gangliocytoma of the cerebellum	10	PTEN

CLINICAL QUESTIONS

Q. A 4-year-old child having palpable abdominal mass and hypertension with sweating and diarrhea is due to:

A. Neuroblastoma
B. Nephroblastoma
C. PCKD (Polycystic kidney disease)
D. All of the above

Answer: A

Solution

Neuroblastoma produce catecholamines- cause increased sweating and hypertension, and release vasoactive intestinal peptide, causing a profound secretory diarrhea.

OTHER OPTIONS

- Nephroblastoma- abdominal mass, fever, hypertension, hematuria
- PCKD- enlarged kidneys, hypertension, renal failure

Neuroblastoma:

- MC abdominal tumor of childhood
- 98%- sporadic, 2%- familial
- MC site- Adrenal medulla
- **Clinical features:**
  - 90% Neuroblastomas produce catecholamines- cause increased sweating and hypertension, and release vasoactive intestinal peptide, causing a profound secretory diarrhea.
  - Fever
  - Failure to thrive
  - Bone pain
  - Bluish S/C nodules
  - Proptosis

Reference: Nelson's 20/e p 2461-2463, Ghai 9/e 611

Q. A 2-year-old male child presents with a lump in the right side of the abdomen. Ultrasound revealed it to be a solid mass. On examination, his right arm and leg were found to be longer. The most likely diagnosis is:

A. Wilms' tumor
B. Neuroblastoma
C. Angiomyolipoma
D. Nephroma

Answer: A

Solution

- The finding of right arm and leg to be longer suggests hemihypertrophy.
- This is a feature of **Beckwith Wiedemann syndrome** associated with Wilms tumor.

Wilms tumor (Nephroblastoma):

- Most common initial presentation of wilms tumor – Asymptomatic Abdominal mass noticed by parents while bathing or clothing
- Congenital syndromes associated with Wilms tumor
  - WAGR sydrome- Wilms tumor, Aniridia, genitourinary abnormalities, mental retardation
  - Denys Drash syndrome- Early-onset renal failure with renal mesangial sclerosis, gonadal dysgenesis (male pseudohermaphroditism)
  - Beckwith Wiedemann syndrome- Organomegaly (liver, kidney, adrenal, pancreas) macroglossia, omphalocele, hemihypertrophy

Other options

Neuroblastoma

- Most common abdominal tumor of childhood
- Most common site- Adrenal medulla
- Clinical features:
  - 90% Neuroblastomas produce catecholamines- cause increased sweating and hypertension, and release vasoactive intestinal peptide, causing a profound secretory diarrhea.
  - Fever, Failure to thrive, Bone pain, Bluish S/C nodules, Proptosis

Mesoblastic nephroma

- Most common solid renal tumor identified in the neonatal period
- Most frequent benign renal tumor in childhood
- Diagnosed with prenatal ultrasound and can manifest as polyhydramnios, hydrops, and premature delivery

Angiomyolipoma:

- Benign renal neoplasm composed of fat, vascular, and smooth muscle.
- Usually present with flank pain, palpable tender mass, and gross hematuria

Reference: Nelson's 20/e p 2461-2466, Ghai 9/e 609

54 BLEEDING & COAGULATION DISORDERS

ITP (IDIOPATHIC/IMMUNE THROMBOCYTOPENIC PURPURA) 00:00:20

- What is it?
  - Immune mediated quantitative disorder of platelets
- **C/F**
  - Peak age: 1-4 yr
  - In an otherwise well child, generated onset of petechiae & purpura.
  - H/o preceding viral illness 1-4 week ago.
- **Investigation**:
  - Platelet count low: < 1 lakh/mm3
  - Anemia +/-
  - Coagulation profile normal
  - Platelet size normal/ increased
  - BM- compensatory Increase in megakaryocytes
  - HIV/ COOMBS test/ ANA
- **Treatment**
  - Platelet transfusion: usually avoided unless life threatening bleeding is present
  - IVIg
  - IV anti D therapy: used in Rh positive patients
  - Prednisolone
  - Splenectomy: in severe/ refractory/ life threatening ITP
  - Rituximab
  - Agents that stimulate thrombopoiesis: Eltrombopag, Romiplostin

NEONATAL ALLOIMMUNE THROMBOCYTOPENIA 00:08:55

- Caused by maternal Abs against fetal platelets Ags inherited from father
- Ag MC responsible: HPA1a> HPA5b
- Maternal Abs cross placenta & destroy platelets in fetus
- 50 % of cases are in 1st pregnancy
- **C/F:**
  - bleeding is severe in affected neonates
  - Even ICH is common

HEMORRHAGIC DISEASE OF NEWBORN (HDN) 00:11:32

- Now called "Vitamin K" deficiency bleeding (VKDB)
- **Classification**

Refer Table 54.1

- C/F: petechiae, gum bleeding, ICH
- Investigation: increased PIVKA
- **Prevention/ Treatment**: Inject Vit K 1mg intra muscularly to all neonates at birth

HAEMOPHILIA A 00:15:32

- Deficiency of Factor VIII
- X linked recessive: more common in males
- **Classification**
  - Mild (>5%)
  - Moderate (1-5%)
  - Severe (<1% factor level)
- **Clinical Features**: Bleeding, Hemarthrosis (earliest joint involved: ankle fb knee joint)
- **Investigation**: Increased aPTT but normal PT, BT, platelet counts, low factor VIII levels
- **Treatment**
  - Factor VIII replacement.
  - If not available – use Fresh frozen plasma (FFP)

HEMOPHILIA B 00:19:46

- XLR
- Due to deficiency of factor IX
- Cryoprecipitate cant be used in hemophilia B

FACTOR 12 DEFICIENCY 00:20:39

- Elevated aPTT
- No bleeding symptoms

FACTOR 13 DEFICIENCY

00:21:18

- Normal aPTT, PT, thrombin time, fibrinogen level
- Urea clot lysis test +ve
- C/F: bleeding from umbilical cord stump, recurrent epistaxis, hematuria, hematochezia

VWD

00:23:04

- VWF is carrier of factor VIII
- Intrinsic pathway affected: increased aPTT
- VWF helps in platelet adhesion to wall of vessel: increased BT
- Desmopressin is helpful in Type 1 VWD

Table 54.1

	Early onset	Classical disease	Late onset
Age	**0-24 hrs**	**2-6 weeks**	**1-6 months**
Etiology	• Maternal drugs e.g. Phenytoin, Rif, INH	• Vitamin K deficiency • Exclusively Breast fed baby born at home	• Cholestasis • Abetalipoproteinemia • Warfarin ingestion

LEARNING OBJECTIVES

UNIT 15: PEDIATRIC GASTROENTEROLOGY

- Dis. Of GIT including diarrhea
  - Esophageal disorders
  - Diarrhea: acute & persistent
  - Lactose intolerance
  - Celiac disease
  - Inflammatory bowel disease
  - Some others

- Liver disorders
  - Hyperbilirubinemias
  - Portal HTN
  - Wilson disease
  - Reye syndrome

55 DISORDERS OF GI SYSTEM INCLUDING DIARRHEA

ESOPHAGEAL DSIORDERS

1. GASTRO ESOPHAFEAL REFLUX DISEASE [GERD] 00:03:07

- MC esophageal disorder in children
- Physiological GERD may be seen in infancy & resolves in upto 90% by 12 months age
- Pathologic GERD: Clinical manifestations because of frequent or persistent GER producing respiratory symptoms, esophagitis related symptoms, or nutritional effects (failure to thrive).

Diagnosis

1. Contrast esophagogram (Barium swallow) → poor sensitivity & specificity →but gives clue about achalasia or esophageal strictures
2. 24 hours Esophageal pH monitoring → quantitative & sensitive documentation of acidic reflux episodes
3. Endoscopy for erosive esophagitis / strictures.
4. GER scan – Radionucleotide scintigraphy
5. Multichannel intraluminal impedance measurement - a cumbersome test for understanding esophageal function

Management

1. Conservative therapy & lifestyle modification: 1st line of management
   - Thickening of feeds
   - Positioning: Prone/ upright position
2. Pharmacotherapy
   - Anti acids
   - H_2 receptor antagonists eg., Ranitidine
   - PPIs eg., omeprazole, Pantoprazole
3. Surgery: Fundoplication for intractable GERD with refractory esophagitis

2. ESOPHAGEAL ATRESIA (EA) & TRACHEO ESOPHAGEAL FISTULA (TEF) 00:08:47

- 5 types based on presence & location of EA & TEF
- Mc type is type C: Here proximal end is blind distal end has presence of TEF

Clinical features

- H/O of polyhydramnios during the antenatal period
- Neonate has frothing, excessive drooling
  - Coughing with feeds
  - Cyanosis
  - Respiratory distress

> **Important Information**
>
> - H-type Fistula may present later in life with recurrent pneumonia due to aspiration.

EA and TEF comprise a part of 'VACTERAL' association

- V – Vertebral anomalies
- A – Anal Atresia
- C – Cardiac defects
- TE – Tracheoesophageal fistula
- R – Renal and radial anomalies
- L – Limb defect

Diagnosis

- Inability to pass orogastric or nasogastric tube
- On X-ray: Coiled tube in upper esophagus
- Prenatal USG

Treatment: Surgical Repair

3. FOREIGN BODY (FB) IN ESOPHAGUS 00:14:17

- Majorities of FB ingestions occur b/w 6 months & 3 years
- MC FB: Coins & small toy items

Diagnosis

- H/O FB ingestion
- Plain radiographs of neck, chest & abdomen (AP and lateral views)

Treatment:

- Asymptomatic blunt object & coins can be observed upto 24 hours, anticipating passage into the stomach.
- Sharp objects, button batteries or respiratory symptoms require endoscopic visualization and early removal.

DISORDERS OF STOMACH AND INTESTINE

1. Hypertrophic Pyloric Stenosis 00:16:42

Clinical Feature

- Infants with forceful, projectile, non-bilious vomiting presenting between 2-6 weeks of age

On Examination

- Visible peristalsis from left to right.
- Mobile olive shaped mass which is palpable (Best in MID-GASTRIC AREA)
- Easiest to palpate just after an episode of vomiting

Important Information

- **1st born male are MC affected**
- **Maternal erythromycin intake during pregnancy is a risk factor**

Diagnosis

- Hypokalemic metabolic alkalosis with paradoxical aciduria
- USG is sensitive and specific method for diagnosis
- Upper G.I contrast studies shows STRING SIGN or DOUBLE TRACT or SHOULDER Sign

Treatment: Isotonic saline with Potassium to correct dehydration.

Definitive Treatment: RAMSTED'S pyloromyotomy

2. Acute Diarrhea 00:21:16

- **Definition**: Passage of 3 or more liquid or watery stools in a day
- MC cause of diarrhea in children: Rota virus

Important Information

- **MC cause of constipation in children → functional or habitual due to improper toilet training**
- **MC cause of vomiting in a neonate → aerophagy**

- Important consequence of Diarrhoea in children are – Dehydration and malnutrition

Assessment of Dehydration In a Child With Diarrhea

Refer Table 55.1

- If patient has 2 more signs including at least "1 sign" then the child has severe or some dehydration

MANAGEMENT OF ACUTE DIARRHEA IN CHILDREN

1. Hydration

i. No dehydration [PLAN A]: Replacement of ongoing losses by WHO ORS [5-10 ml/kg 1 loose stool]

ii. Some dehydration [PLAN B]: 75 ml/kg over 4 hours [if cannot accept orally, give IV fluid]

STANDARD ORS (used previously)

- Osmolarity - 311
- Sodium - 90 mEq/L

COMPONENTS OF REDUCED OSMOLARITY ORS (or) NEW WHO ORS [in mmoL/L]

- Glucose - 75
- Sodium - 75
- Potassium - 20
- Chloride - 65
- Citrate - 10
- Osmolarity - 245

COMPONENTS OF ReSoMAL [Rehydration solution for malnourished child] [mmolIL]

- Glucose - 125
- Sodium - 45
- Potassium - 40
- Chloride - 70
- Citrate - 7
- Magnesium
- Zinc
- Copper

iii. Treatment of severe dehydration: (PLAN C): [100 ml/kg]

Age	1st 30ml / kg	NEXT 70 ml / kg
< 1 year	over 1 hour	Over 5 hours → 6 hour
> 1 year	over ½ hour	Over 2 ½ hours → 3 hour

Fluid of choice for severe dehydration

- Ringer lactate in 5% Dextrose> Ringer lactate or normal saline

Important Information

- **Dextrose containing fluid alone should not be used**

2. Zinc: Reduces duration and severity of diarrhea in children from developing countries.

- DOSE: 2-6-month age: 10 mg/day; 6-month age: 20 mg/day } Duration in 10-14 days

2. Mantain Normal Diet

4. No Role of antibiotics except in
- Suspected bacterial infections like dysentery (blood, mucus in stool), cholera (rice watery stool)
- Severe malnutrition

3. Persistent Diarrhea in Children 00:38:45

- **Definition**: Diarrhea that start as an acute episode and lasts for at least 14 days
- **Management**:

a. Correction of dehydration
b. Supplement zinc, vit A
c. Dietary modification
   - Initial Diet A (Reduced lactose diet)
   - Second Diet B (Lactose free diet with reduced starch)
   - Third Diet C (Monosaccharide- based diet)

4. Lactose Intolerance in Children 00:41:14

Types

1. Congenital / Primary: due to mutation of lactose gene on chromosome 2, very rare type
2. Acquired / Secondary
- More common type
- Post infectious (following diarrhea)
- Inflammatory
- Radiation
- Drugs

Clinical Features

- Diarrhea, abdominal pain & vomiting, especially on intake of milk products
- Perianal excoriation because of acidic stools

Diagnosis

- Reducing substances positive in stool
- Improvement of symptoms on exclusion of milk & milk products from diet
- Decreased lactase activity in small intestine biopsy

Treatment

- Avoid milk, skimmed milk & milk products like ice cream, skimmed milk
- Curd / yoghurt may be given

5. Celiac Disease 00:44:38

[Gluten Sensitive Enteropathy]

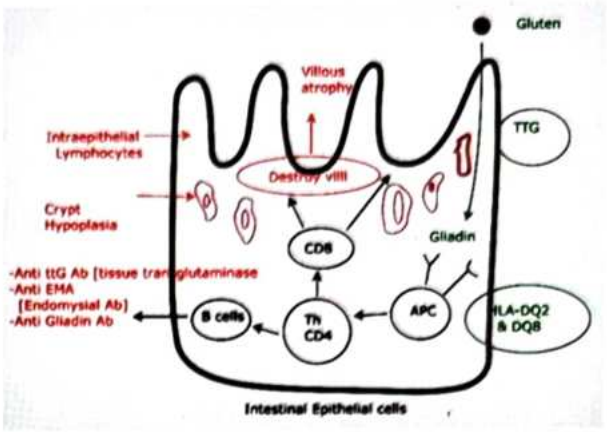
- It is T-Cell mediated autoimmune disorder in which intolerance to wheat, (or rye/barley/oats) containing gluten occurs.

Important Information

Oats are relatively safer in patients with celiac disease.

Etiology

1. Environmental factor due to Gliadin [Component of gluten]
2. Genetic factors associated with HLADQ2 & HLADQ8 haplotypes
3. Immunological factors
- Anti TTG (Tissue Trans Glutaminase)
- Anti Endomysial Antibody (EMA)
- Anti DGP (Deaminated gliadin peptide)



Clinical Features

In later part of infancy or subsequently, it manifests as

System	Manifestation	Possible cause
GIT	Diarrhea, abdominal distension, Vomiting, anorexia, ftt, aphthous Stomatitis	Atrophy of small Bowel mucosa causing malabsorption
Hematology	Anemia	Iron & other vitamins Malabsorption
Skeletal	Rickets, osteoporosis, dental, Enamel hypoplasia	Ca/ vit D Malabsorption
Muscular	Atrophy	Malnutrition
Neurology	Peripheral neuropathy, Irritability, seizures	Thiamine, vit B 12 Deficiency
Endocrine	Short stature	Malnutrition, ca/ Vit d deficiency
Immunology	Hypersplenism	Not known

Important conditions associated with Celiac Disease

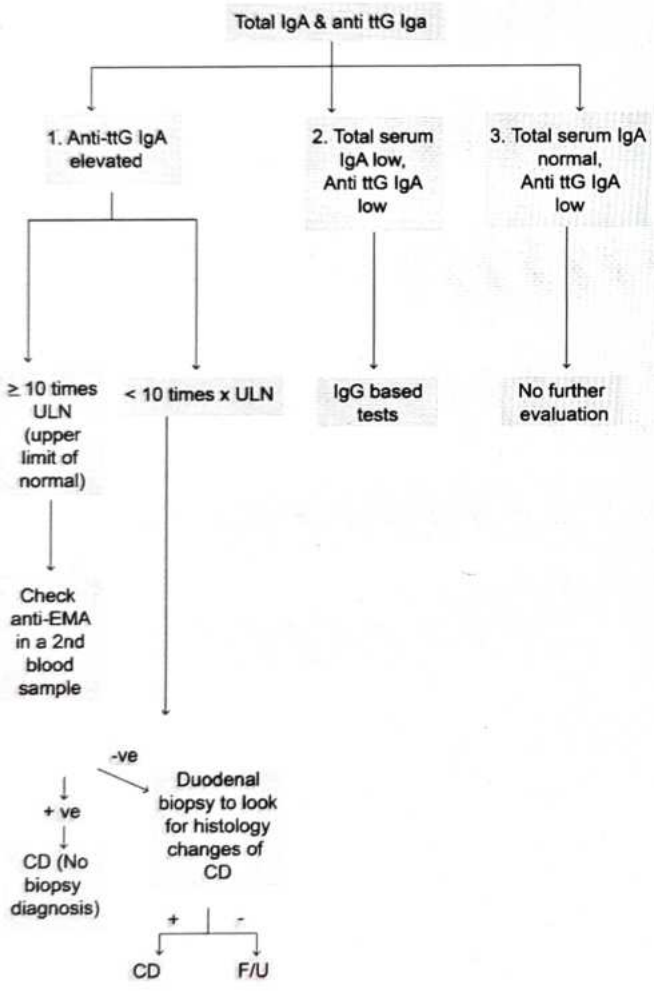
- Dermatitis herpetiformis - Doctor
- Down syndrome - Don't
- William's syndrome - W
- Addison's disease - A
- Ig A deficiency - I
- Turner syndrome - T
- Type 1 DM - Today

How to remember

- Doctor Don't WAIT Today

Diagnosis

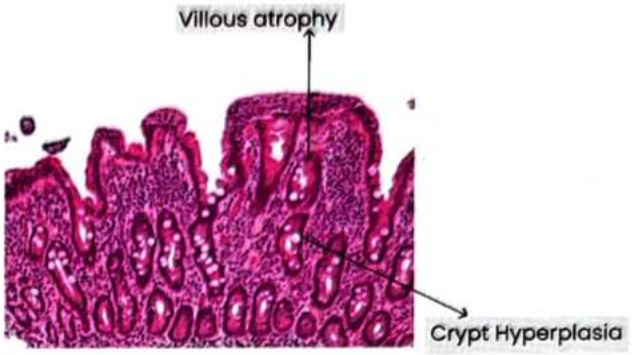
- Latest ESPGHAN (European society for Ped. Gastroent. Hepatology & Nutrition) guidelines 2019
- For initial screening for CD: combination of total serum IgA is more accurate than other tests.



Important Information

- HLA DQ2 or DQ8 testing & presence of symptoms are not obligate criteria for "NO-Biopsy" diagnosis of CD.

- Duodenal biopsy in CD



- Intestinal biopsy: Marsh grading
  0, 1: normal
  2,3: CD

Treatment

- Lifelong gluten free diet

6. **Inflammatory Bowel Disease** 01:06:18

- Chronic recurrent disease characterized by intestinal inflammation

2 Types

1. Ulcerative Colitis: Involves the Rectum
2. Crohn's disease:

- Skip lesions
- Non caseating granuloma
- Rectum is usually spared

Clinical Feature: Depends on site of involvement & severity

Ulcerative Colitis

- Involvement of rectum causes TENESMUS, Fecal urgency, Blood in stool
- Involvement of sigmoid colon causes constipation
- Involvement of descending colon causes Bloody diarrhea with pus and abdominal pain

Crohn's Disease

- Ileocolitis (involvement of Ileum and colon): causes recurrent abdominal pain and diarrhea

- Jejunoileitis: Malabsorption, low grade fever, steatorrhea, weight loss
- Colitis and Perianal involvement: cause fever, hematochezia stricture & fistula formation-

Important Information

- **Rectum is usually spared in Crohn's ds**
- **MC part involved in CROHN'S: Terminal Ileum**

Investigation of IBD

- Anemia of leukocytosis
- Increased ESR and CRP
- PANCA elevated in 60-70% cases of U. Colitis
- ASCA (Anti – Saccharomyces cerevisiae Ab) elevated in 60-70% cases of Crohn's disease

Treatment

- 5- Amino salicylic acid (5-ASA)
- Glucocorticoids
- Cyclosporin
- Azathioprine

In mild Ulcerative colitis: Sulfasalazine
In severe cases where strictures / fistulas are present: Surgery required

7. Hirschsprung Disease

01:12:40

- a.k.a Congenital Aganglionic Megacolon
- what is it? Occurs due to premature arrest in the descent of neural crest cells, which form the ganglions in the intestine.
- Pathogenesis

a. Recto sigmoid colon involved in 80% cases.
b. No peristalsis/infolding
c. Not able to relax: dilatation of proximal normal band

Clinical features

- Neonates may present with failure to pass (or delayed passage) of meconium (greenish-black due to bile pigments), abd. distension, bilious vomiting, feed intolerance

↓

Dilatation of proximal normal bowel & increasing abd. Distension

↓

Intraluminal pressure increases

↓

Decreased blood flow, deterioration of mucosal barrier & stasis

↓

Proliferation of bacteria

↓

Enterocolitis (fever, toxic look, sepsis)

Diagnosis

- Rectal suction biopsy: gold standard
  - Absence of ganglion cells
  - Presence of hypertrophy of nerve trunks: Acetylcholierase or Calretinin staining
- Anorectal manometry: internal anal sphincter fails to relax in response to rectal dilatation
- Unprepared contrast enema: an abrupt transition zone between the normal dilated proximal colon & a small caliber obstructed, distal aganglionic segment.

Treatment

- surgery (surgical resection of involved segment, anastomosis of normal segment)
- enterocolitis: IV antibiotics
- general supportive care

Important Information

- **MC cause of lower intestinal obstruction in neonates: Hirschsprung disease**

8. Intussusception

01:30:25

- Definition: When 1 portion of alimentary tract is telescoped into an adjacent segment

Clinical Feature

- Sudden onset severe paroxysmal colicky pain/ excessive crying + currant jelly stools + tender, sausage shaped palpable mass in abdomen

Important Information

- MC cause of intestinal obstruction in 3 month - 6 year of age: INTUSSUSCEPTION
- MC type: ILEOCOLIC
- Swollen peyer's patches in response to GI infection or introduction of new food can predispose to intussusception

Important Information

- This disease predisposes to cancer of breast, colon, rectum and reproductive organs.
- Lifetime risk of cancer in these patients is 47-93%.
- GI surveillance with upper & lower GI endoscopies is recommended beginning in childhood by 8 years of age or when symptoms occur.

Diagnosis

- USG has good sensitivity in diagnosis.
- Barium enema shows COILED Spring Sign Or Claw Sign

9. **Bowel Atresia** 01:33:57

- DUODENAL ATRESIA accounts for 25-40% of cases.
- HALLMARK of duodenal atresia: Bilious vomiting without abdominal distention
- H/O polyhydramnios in 50% cases
- On x-ray abdomen: Double Bubble Sign

10. **Peutz – Jegher Syndrome** 01:35:17

- A.D inheritance
- Patients with positive family history
- Mucocutaneous pigmentation seen
- Polyps mainly in small intestine(MC in Jejunum> Ileum > Duodenum)
- Extensive G.I Hamartomatous polyposis
- Maybe colonic/ gastrin polyps are present
- These polyps leads to abdominal cramping and bleeding

Table 55.1

Parameters	No dehydration	Some dehydration	Severe dehydration
Sensorium	Well alert	"Restless, irritable"	"Lethargic, floppy"
Eyes	Normal	Sunken	Very sunken & dry
Tears	Present	Absent	Absent
Mouth & tongue	Moist	Dry	Very dry
Thirst	Drinks normally, not thirsty	"Thirsty, drinks eagerly"	"Drinks poorly/ not able to drink"
Skin pinch	Goes back quickly	"Goes back slowly"	"Goes back very slowly"

CLINICAL QUESTIONS

Q. A 6-year-old male child brought to the hospital with a complaint of frequent regurgitation of food postprandially. He also reported having burning sensations over the chest to his mother. Which of the following is the Gold standard investigation for this disease?

A. Endoscopy
B. 24 hour esophageal pH recording
C. Oesophageal manometry
D. Measurement of length of lower oesophageal sphincter

Answer: B

Solution

24 hour Esophageal pH recording provides a quantitative & sensitive documentation of acidic reflux episodes.

Gastroesophageal Reflux Disease (GERD)

- Gastroesophageal Reflux (GER) is passage of gastric contents across the lower esophageal sphincter (LES) into the esophagus with or without vomiting.
- GER is a normal physiologic process but if it causes troublesome symptoms and/or complications, it is known as GERD.
- Clinical features:
  - Poor weight gain
  - Heartburn or chest pain (older children)
  - Hematemesis, dysphagia and odynophagia (if complicated by esophagitis or stricture esophagus)
  - Wheezing, stridor, cough and hoarseness
  - Sandifer syndrome
- Investigations:
  - 24 hour esophageal pH recording → Provides a quantitative & sensitive documentation of acidic reflux episodes.
  - Contrast (usually barium) radiographic study of the esophagus and upper GI tract → Helps rule out anatomic abnormalities of the upper gastrointestinal tract
  - Upper GI endoscopy → Helps in diagnosis of reflux esophagitis, stricture esophagus and Barrett's esophagus
  - Endoscopic biopsy → To evaluate other causes of esophagitis and to diagnose Barrett's esophagus
  - Nuclear scintigraphy → Helps in diagnosis of pulmonary aspiration in patients with chronic GERD
  - Multichannel intraluminal impedance → for diagnosing GERD and for understanding esophageal function

Reference: Nelson's 20/e pg-1787-1788, Ghai 9/e p 275

Q. 3 years old female child brought to the hospital with a complaint of swallowing a coin. Radiography reveals the coin is dislodged in the esophagus. The patient presents with no difficulty of breathing. Which of the following is the appropriate treatment?

A. Endoscopic removal after 24 hours
B. Immediate endoscopic removal
C. Wait for 48 hours
D. Dislodge the coin to the stomach by inserting Ryle's tube

Answer: A

Solution

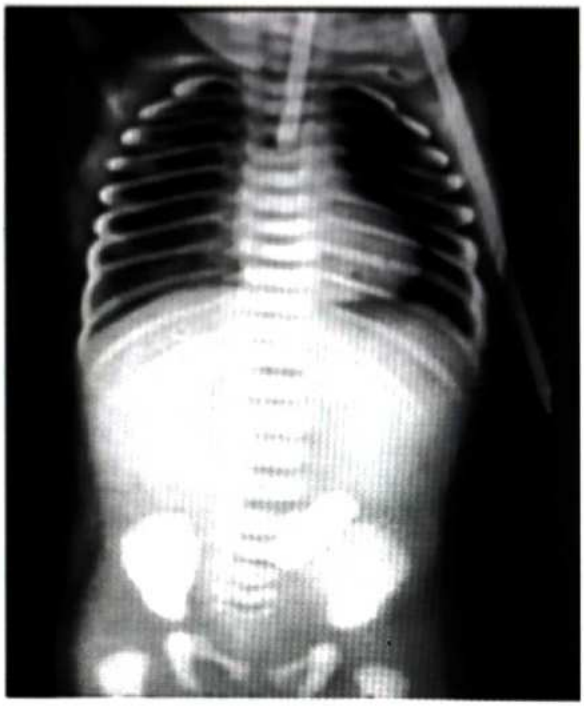
- Asymptomatic blunt objects and coins can be observed for up to 24 hours in anticipation of their passage into the stomach. If they still remain lodged in the esophagus, endoscopic removal is warranted.

** Sharp objects, disk button batteries, or foreign bodies associated with respiratory symptoms require urgent removal.

** In management of a child with an esophageal foreign body, it is always important to assess risk for airway compromise and to obtain a chest CT scan and surgical consultation in cases of suspected airway perforation.

Reference: Nelson's 20th/ed page - 1793-1794

Q. A newborn baby with a single umbilical artery presents with difficulty in insertion of Ryle's tube. X-ray reveals the below-depicted image. Which of the following is the most possible diagnosis?

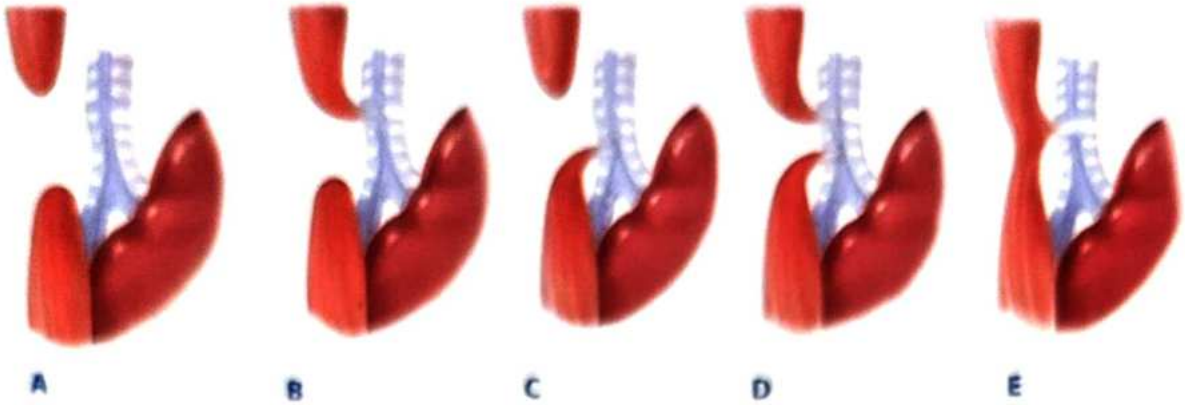


A. Isolated Esophageal atresia
B. Esophageal Atresia with proximal Tracheo-Esophageal Fistula
C. Esophageal Atresia with distal Tracheo-Esophageal Fistula
D. Both A & B

Answer: D

Solution

- -X-ray presents with obstruction of Ryle's tube near the bifurcation of the trachea with a gasless abdomen
- In EA with proximal TEF, as there is no connection of the distal esophagus with the trachea or proximal esophagus, a gasless abdomen will be seen on X-ray.
- On X-ray, an air bubble is seen in the stomach if there is communication between the lower part of the esophagus and trachea and/or proximal esophagus. Ex: In types C, D, and E TEF



Classification of TEF:

- **Type A:** Atresia only (60%)
- **Type B:** Atresia with proximal TEF (2%)
- **Type C:** Atresia with distal TEF **(85%): most common**
- **Type D:** Atresia with proximal and distal TEF (rare)
- **Type E:** Isolated TEF (H-type) (1%)

Reference: Nelson's 20/e p 1783, Ghai 9/e p 172

56 IMPORTANT LIVER DISORDERS IN CHILDREN

I. UNCONJUGATED HYPERBILIRUBINEMIA

00:00:58

Increased production	Decreased conjugation

• Hemolytic disorders
• Ineffective erythropoiesis
	• Gilbert syndrome
	  ○ Mild deficiency of UDPGT
	  ○ Increase during stress, fasting, fatigue
	• Criggler Najjar syndrome
	  ○ Type I: severe, complete absence of UDPGT
	  ○ Type II: Milder illness with decreased UDPGT

II. CONJUGATED HYPERBILIRUBINEMIA

00:04:59

- **Dubin Johnson Syndrome**
  - Impaired excretion of conjugated bilirubin due to mutation in canalicular multidrug resistance protein 2 (MRP-2)
  - Dark pigmentation of liver.
- **Rotor Syndrome**
  - Decreased hepatic uptake, storage & biliary excretion of bilirubin.
- **PFIC** (Progressive Familial Intrahepatic cholestasis)
  - Severe cholestatic jaundice beginning in childhood
  - 3 types: GGT enzyme level elevated only in PFIC type 3
- **Biliary Atresia (Extra Hepatic Biliary Atresia/EHBA)**
  - Screening test: HIDA Scan (hepatic scintigraphy)
  - Surgery: Kasai procedure. It has good outcome if done <8 weeks of age.

Important Information

- MC indication of liver transplant in children: Biliary atresia.

- A very close Differential of EHBA is neonatal hepatitis

	Neonatal Hepatitis	Biliary Atresia
Onset	• Anytime in neonatal period	• By end of 1st week of life.
Severity	• Mild to moderate Jaundice	• Moderate to severe Jaundice
Color of stool	• Variable	• Clay colored
Alkaline Phosphatase	• Usually normal	• Increased
USG abdomen	• Identifies choledocholithiasis or choledochal cysts	• "Triangular cord sign"
HIDA scan	• Radioactivity scan in intestine	• No radioactivity in intestine
Liver biopsy	• Distortion of lobular architecture, giant cells, inflammation.	• Bile ductular proliferation; portal or peri-lobular edema & fibrosis.
Operative cholangiogram	• Normal	• Usually determines presence & size of obstruction.

Previous Year's Questions

Q. In a neonate on phototherapy, bilirubin is converted into? (AIIMS June 2020)
A. Biliverdin
B. Lumirubin
C. Urobilin
D. Stercobilin

III. PORTAL HYPERTENSION IN CHILDREN

00:17:28

- Elevation of portal pressure >10-12mm Hg
- Due to obstruction to portal blood flow, anywhere along the course of portal venous system.

Causes

A. Prehepatic (Presinusoidal)
- Due to portal vein obstruction from any cause.
- Portal vein thrombosis is the MC cause of extrahepatic portal hypertension
- Neonates: Omphalitis, UVC, dehydration, sepsis
- Older children: Appendicitis, peritonitis, inflammatory bowel disease, Hypercoagulable state.

Important Information

- **Most common cause of portal hypertension in children: EHPVO (Extrahepatic portal venous obstruction)**

B. Intrahepatic (Sinusoidal)

Important Information

- **MC intrahepatic cause of portal hypertension in children: Cirrhosis**

- Important causes of Cirrhosis in children:
  - Biliary atresia
  - Chronic viral hepatitis
  - Autoimmune hepatitis
  - Metabolic liver disease
    → In some children, non-cirrhotic portal fibrosis (NCPF)

C. Post-hepatic (Post-sinusoidal)
- Budd Chiari syndrome
- Veno-occulsive disease

BUDD CHIARI SYNDROME

00:25:14

- Due to obstruction to Hepatic veins anywhere between the efferent hepatic veins to the entry of IVC into right atrium
- Due to
  - Hypercoagulable structure
  - Malignancy
  - Inflammation bowel disease
  - Bechet syndrome

VENO-OCCULSIVE DISEASE

00:27:10

- MC cause of hepatic venous obstruction in children
- Occlusion of centrilobular venules or sub lobular hepatic veins
- It occurs most frequently in BM transplant recipients after total body irradiation.

Clinical features of portal hypertension
- Bleeding is the most common presentation of portal hypertension in children.
- Splenomegaly
- Ascites
- Growth failure
- Cyanosis, Clubbing, dyspnea (hepatopulmonary syndrome)

VIRAL HEPATITIS IN CHILDREN

00:30:16

Clinical Features
- Jaundice/icterus
- Tender hepatomegaly ± Splenomegaly ± Lymphadenopathy
- Extrahepatic features eg., arthritis, rash – MC in Hep B/C
- Acute Liver Failure
  - Bleeding
  - Altered sensorium
  - Elevated Patient, unresponsive to Vitamin K.
- **Hepatitis A**
  - Highly contagious
  - Feco-oral route
  - Mean incubation period -3 week
- **Hepatitis B**
  - Incubation period: 45-160 days(av. 120 days)
  - In children, most important risk factor for acquisition of HBV is perinatal exposure to HBsAg positive mother.
  - Risk of transmission is greatest if
    → Mother is HBeAg positive
    → High maternal HBV viral load

→ Delivery of a prior infant who developed Hep B despite of prophylaxis
- Prophylaxis

a. Both Hep B Ig & Hep B vaccine should be given within 12 hours of delivery Prevents Hep B infection in neonates in >95% cases.

- **Chronic Hep B**
  - Risk of developing Chronic Hep B (HBs Ag positive for >6months) is inversely related to the age of acquisition of infection.
    → Risk of Chronic Hep B in:
    - Children < 1year: 90%
    - Year: 30%
    - Adults: 2%

    → 1-5% cases may develop fulminant Hepatitis
    → Risk increased if
    - Co-infection/super infection with HDV
    - Host is immunocompromised.

    → RX OF HEP B in children:
    - Acute-Supportive
    - Chronic Hep B: Rx required for patients with immune- active form of disease
    - Drugs used
      i. IFN alpha 2b
      ii. Pegylated Interferon alpha 2
      iii. Lamivudine
      iv. Adefovir, Tenofovir
      v. Entecavir
- **Hepatitis-C in children**
  - Most common mode of transmission is perinatal.
  - Most common Hepatitis to cause Chronic Inflammation: Hep C
  - Rx for Chronic Hep C: Pegylated IFN alpha 2b & Ribavirin.
- **Hepatitis E**
  - Affects older patients
  - Feco-oral transmission
  - Most severe in pregnant females.

WILSON DISEASE

00:44:45

- Autosomal recessive
- ATP 7B gene mutation (Chr 13q 14)
- Decreased biliary copper excretion & accumulation of copper in hepatocytes.
- **Clinical features**
  - Hepatic: Hepatomegaly, Hepatitis, liver failure, portal hypertension, ascites
  - Hematologic: hemolytic anemia
  - CNS: Tremors, dysarthria, dystonia, chorea.
  - Eye: KF ring (Kayser Fleischer ring) & Sunflower cataract.
  - Renal: Fanconi syndrome, renal failure
- **Investigation**
  - Decreased Serum ceruloplasmin level.
  - Serum free copper level may be elevated
  - Urinary copper excretion increased
  - Hepatic copper content > 250 microgm/gm of dry liver weight
  - KF ring: On slit lamp exam of eye.
- **Treatment**
  - Restrict dietary copper intake
  - Avoid liver, shellfish, nuts, chocolates
  - Use Cu chelating agents like
    → d- penicillamine
    → Zinc
    → Trientine

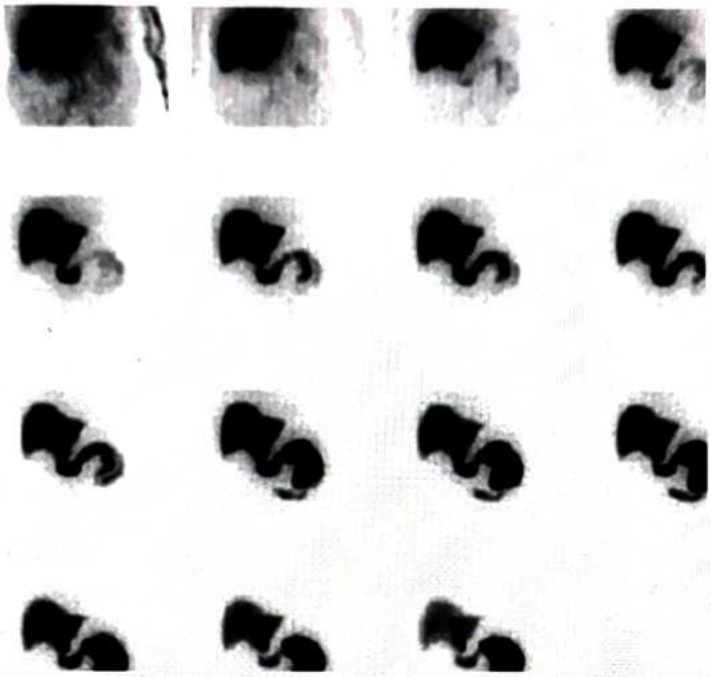
REYE SYNDROME

00:51:24

- Acute metabolic disorder resulting in generalized mitochondrial dysfunction due to inhibition of fatty acid oxidation.
- Also known as "Jamshedpur Fever".
- Fatty liver & encephalopathy seen
  - Cerebral edema
  - Hepatic encephalopathy
- Reye syndrome can be precipitated by
  - Drugs (NSAIDS)
  - toxins
  - IEM
  - viruses e.g.: Coxsackie V, Influenza V, Adeno V, Varicella V (not by RSV).
- **Clinical features**
  - Features of hepatic dysfunction- Hypoglycemia, Bleeding (prolonged patient) But Jaundice is rare.
  - Seizures & encephalopathy seen in > 80%
- **Case Scenario**: A 3-year male child with fever 5 days was given some medication (Aspirin), developed anorexia, vomiting, altered sensorium, Seizures; O/E: No jaundice but hepatomegaly seen
  - On Investigation: Hypoglycemia, prolonged PT
  - Diagnosis: Reye syndrome
- **Prognosis**: Poor (Mortality 25-70% cases)

CLINICAL QUESTIONS

Q. A 20-day-old baby presented with conjugated hyperbilirubinemia and clay coloured stools. What is the following investigation done to know whether the baby has biliary atresia?



A. Ultrasound abdomen
B. Hepatic scintigraphy
C. Barium meal
D. GER scan

Answer: B

Solution

Given scenario suggests neonatal cholestasis and Hepatic scintigraphy or HIDA scan is done to rule out biliary atresia

- HIDA scan is more relevant for its negative predictive value (100%) as presence of excretion into gut rules out biliary atresia.
- No excretion in gut in HIDA scan can be seen in both biliary atresia and severe intrahepatic cholestasis. So the absence of excretion does not necessarily mean biliary atresia.

Liver biopsy is an accurate (90-95%) test for differentiating biliary atresia from other causes of neonatal cholestasis.

-Ultrasound of abdomen is more useful in determining the presence of dilated CBD/intrahepatic biliary radicle dilatation (seen in choledochal cyst)

Reference: Nelson's 20/e p 1975; Ghai 9th ed/p- 325-327

Q. A 2-yr-old child presented to the emergency department with severe abdominal pain associated with nausea and vomiting. On examination, the patient presented with hepatomegaly. Which of the following will not be the cause for hepatomegaly?

A. Hydatid disease
B. Hepatoblastoma
C. Cirrhosis
D. Glycogen storage disease

Answer: C

Solution

In cirrhosis, the liver is usually shrunken, leading to non-palpable liver.

Causes of hepatomegaly:

Chronic liver disease (cirrhosis or chronic hepatitis): Wilson disease, chronic hepatitis B and C, autoimmune liver disease, Budd-Chiari syndrome, cryptogenic

Metabolic or storage disorders: Glycogen storage disease, Gaucher disease, Niemann-Pick disease, progressive familial intrahepatic cholestasis, nonalcoholic fatty liver disease

Infective: Viral hepatitis, liver abscess (pyogenic or amoebic), tuberculosis, salmonella, malaria, kala-azar, hydatid disease

Tumors: Lymphoma, leukemia, histiocytosis, neuroblastoma, hepatoblastoma, hepatocellular carcinoma

Biliary: Caroli disease, choledochal cyst, congenital hepatic fibrosis, extrahepatic biliary obstruction

Miscellaneous: Congestive heart failure, constrictive pericarditis, sarcoidosis

Reference: Nelson 20/e p 709; O.P. Ghai 9/e pg-307

Q. A 10 years old girl presents to the hospital with complaints of hematemesis. 5 days back, the patient underwent tonsillectomy. Upon examination, the reactionary hemorrhage has been ruled out, and GI endoscopy was planned. GI endoscopy reveals the presence of esophageal varices. Your provisional diagnosis comes to portal hypertension. which of the following is responsible for the cause of post-hepatic Portal Hypertension?

A. Portal vein thrombosis
B. Banti Syndrome
C. Budd-Chiari Syndrome
D. Congenital hepatic fibrosis

Answer: C

Solution

Post-sinusoidal causes of Portal hypertension include: Budd-Chiari syndrome and Venoocclusive disease

Portal hypertension:

- Elevation of portal pressure >10-12 mm Hg due to obstruction to portal blood flow anywhere along the course of portal venous system.
- Causes of portal hypertension:

Presinusoidal	Sinusoidal	Post-Sinusoidal
Extra-hepatic • Splenic vein thrombosis • Splenomegaly • Splenic arterio-venous fistula • Hypercoaguable states **Intrahepatic** • Schistosomiasis • Congenital hepatic fibrosis • Nodular regenerative hyperplasia • Idiopathic portal fibrosis • Myeloproliferative disorder • Sarcoid & GVHD	**Intrahepatic** Cirrhosis due to • HBV, HCV (chronic viral hepatitis) • Metabolic liver disease • Autoimmune hepatitis • Primary biliary cirrhosis & PSC In some children, Non-cirrhotic portal fibrosis (NCPF)	**Intra-hepatic** • Veno-occlusive disease **Post-hepatic** • Budd Chiari syndrome • Congestive heart failure • IVC web • Constrictive Pericarditis

Reference: Nelson's 20/e p 1973, Ghai 9/e p 317

LEARNING OBJECTIVES

UNIT 16: PEDIATRIC RESPIRATORY SYSTEM

- **Imp. Resp disorders in children**
  - **Congenital malformations of airways and lungs**
  - **Cystic fibrosis**

- **Bronchial asthma**
  - **Asthma : types, etiology, pathophysiology, C/F, investigations, treatment**

- **Infections of airways and lungs**
  - **Acute pharyngitis**
  - **Acute epiglottis**
  - **Croup**
  - **Acute bronchiolitis**
  - **Pneumonia**

57 IMPORTANT RESPIRATORY DISORDERS IN CHILDREN

DIFFERNECE BETWEEN PEDIATRIC & ADULT AIRWAY

00:00:26

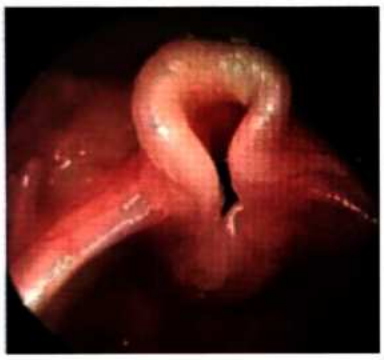
In infant & children

- Large head, short neck & large tongue
- Larynx is more anterior & cephalad
- Epiglottis is relatively long, 'floppy' & U-shaped
- Carina is at T_2 [T_4 in adults]
- Narrowest part of airway in children
  - At cricoid cartilage (Previous)
  - -At Subglottis (Latest)

CONGENTIAL MALFORMATIONS OF AIRWAYS

00:03:06

Laryngomalacia



- Mc causes of stridor in infants
- Stridor is exacerbated by crying, agitation or feeding
- Stridor Improves when the baby sleeps in prone position
- **Symptoms** appear in 1st 2 weeks of life, gradually increase in severity up to 6 months.
- **Diagnosis** confirmed by flexible laryngoscopy: omega shaped epiglottis is seen

CONGENITAL LUNG MALFORMATIONS

00:06:43

1. Pulmonary Hypoplasia

00:07:03

- Defective development of 1 or both lungs

2. Pulmonary Sequestration

00:07:38

- Discrete areas of lung tissues that lack any connection with airway system.
- These areas get Abnormal Blood supply from aorta
- 2 types of pulmonary sequestration

Extra lobar type	Intra lobar type (MC)
• Present External to lungs • Causes mass affect Compressing the lung • Venous return occurs Through IVC	• Occurs within the lung • Manifests due to localized infections or Bronchiectasis • Venous return occurs through pulmonary veins

3. **Congenital Lobar Emphysema [CLE]**

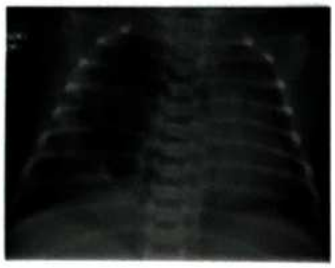
00:10:55

- Over distention of 1 or more lobes of lung
- Left upper lobe is Most commonly involved
- Atelectasis/collapse of ipsilateral normal lobe of lung
- May present in neonatal period with tachypnea, dyspnea & cyanosis
- Surgery may be required in symptomatic cases

4. **Congenital Cystic Adenomatoid Malformation [CCAM] or Congenital Pulmonary Airway Malformation [CPAM]**

00:13:10

- Now known as CPAM (Congenital-Pulmonary Airway Malformation)
- Hamartomatous/ Dysplastic lung tissue, usually confined to 1 lobe
- Present in infancy with
  - Respiratory distress
  - Recurrent respiratory infections
  - Pneumothorax
- **On chest X-ray**: cystic mass, sometimes with MEDIASTINAL SHIFT
- Congenital diaphragmatic hernia close differential diagnosis
- Surgery is indicated in symptomatic cases



FOREIGN BODY ASPIRATION

00:16:06

- Most common in older infant & toddler (1-3 yr)
- Most common objects food items e.g. peanuts, toys, balloons.
- Most serious complication: complete obstruction of airway.
- **Clinical features**
  - Initial event: Violent coughing, choking & gagging immediately after intake.
  - Asymptomatic interval: FB becomes lodged, reflexes fatigue & irritating symptoms subside.
- **Complications**
  - Complete obstruction of airway (most serious): Atelectasis
  - Erosion of bronchus: Hemoptysis
  - Secondary infection: fever & cough
- **Diagnosis**
  - Sudden onset choking/coughing episodes accompanied by new onset wheezing
  - CXR: unilateral hyperinflated lungs due to obstruction emphysema.
    - → Normal in 15-30% cases
    - → Opaque FB seen in 10-25%
- **Treatment:** Prompt removal of FB by rigid bronchoscopy

CYSTIC FIBROSIS

00:21:58

- Autosomal recessive disease, Chromosome 7q
- Primary defect: Abnormal function of an epithelial Chloride channel encoded by CFTR gene (CF Transmembrane Conductance regulator gene) on Chromosome 7q 31.2
- Others defects in

a. K^+ channels (Kir 6.1)
b. Epithelial Na channels (ENaC)

Pathophysiology

Refer Figure 57.1

- Due to dehydrated mucus in CF: There will be blocking of respiratory bronchus & bronchioles
- Due to this, secretions become stagnant leading to Recurrent Infection

- **Clinical features**
  - Respiratory tract
    - → Recurrent Infections
    - → By Staph aureus, H. influenzae first
    - → Later colonization by Pseudomonas aeruginosa

    ↓

    Undergo mucoid transformation in CF airways
    - → Burkholderia capacia is pathognomonic organism of CF.
    - → Bronchiectasis, atelectasis, nasal polyps can be seen
  - Genitourinary: Azoospermia & Infertility
  - GI & Nutritional abnormality: Intestinal – Meconium Ileus
    - → DIOS (Distal intestinal obstruction syndrome)
    - → Rectal prolapse
    - → Recurrent, persistent /chronic diarrhea/ steatorrhea
  - Pancreas: Exocrine Insufficiency
    - → Recurrent acute/chronic pancreatitis.
  - Hepatic: Biliary Cirrhosis
    - → Prolonged neonatal Jaundice
  - Nutrition: Failure to thrive, hypoproteinemia, Vitamin deficiencies, salt depletion, metabolic alkalosis

- **Diagnostic Criteria of CF**
  - Require the presence of One or more characteristic phenotypic features
  - A history of cystic fibrosis in a sibling Or
  - A positive newborn screening test result on IRT (Serum Immunoreactive Trypsinogen)

    And
    - → Increased sweat chloride [> 60 mmol/L] concentration on 2 or more occasions Or
    - → Identifications of two cystic fibrosis mutations Or
    - → Demonstration of abnormal nasal transepithelial potential difference

- **Treatment**
  - Pulmonary: Bronchodilators
    - → Hypertonic saline
    - → Human recombinant DNase inhalation
    - → Aerosolized -oral/IV antibiotics
    - → Chest physiotherapy
    - → Respiratory support (PPV) if required

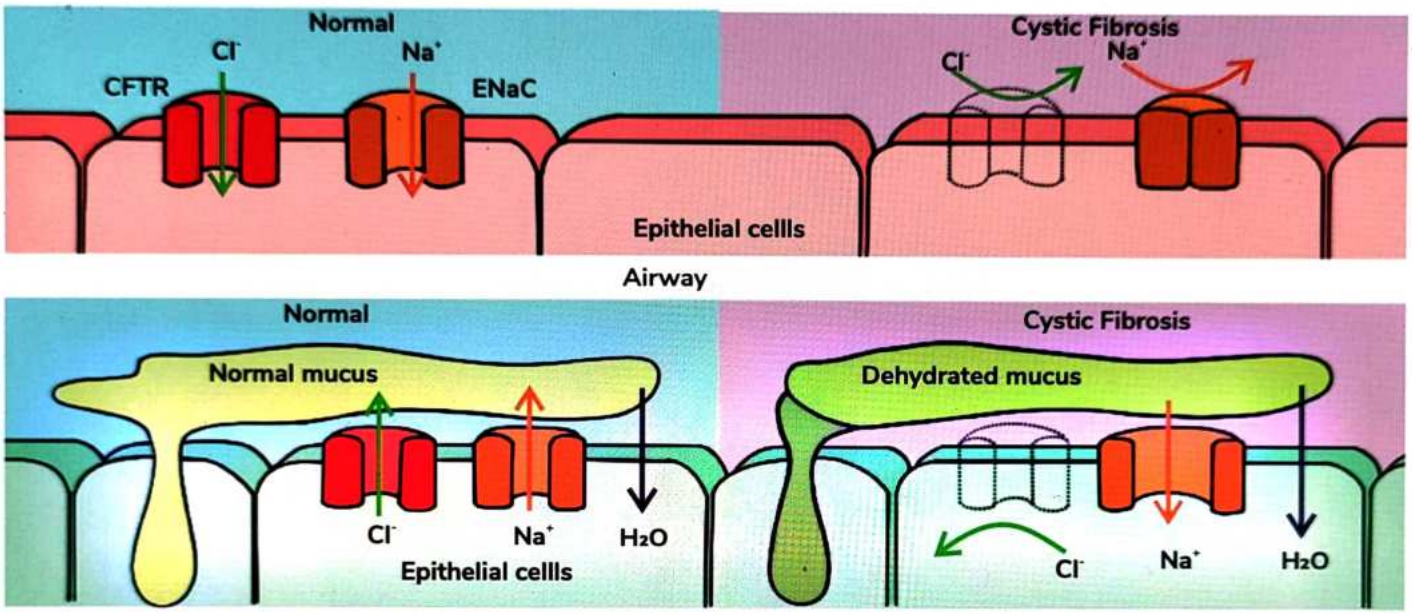
- Nutrition: High Calorie Diet
  - → Pancreatic enzyme supplements
  - → Fat Soluble Vitamins
  - → Mineral Supplements.
- Rx of bowel complication: E.g. meconium ileus, pancreatitis, appendicitis, rectal prolapse etc.

Previous Year's Questions

Q. A 9 yr old child presented with recurrent chest infections, greasy, loose, bulky stools. Stool fat is > 10 gm/ day. What is the correct statement?

A. Hypernatremia is common
B. Protein losing enteropathy is common
C. Distal intestinal obstruction is common in this age
D. Rectal prolapse is common complication of treatment

Figure 57.1 Pathophysiology



CLINICAL QUESTIONS

Q. A 4-year-old child developed sudden bouts of cough & respiratory distress after eating peanuts. His Chest X ray shows the following;

Diagnosis?

A. Obstructive emphysema right side
B. Obstructive emphysema left side
C. Pneumonia
D. Bronchiectasis

Answer: B

Solution

- This chest X-ray shows increased radiolucency of left hemithorax suggestive of hyperinflated chest on left side.
- With a history of acute onset of bouts of cough and respiratory distress especially after eating a peanut makes Foreign body aspiration a highly probable underlying cause and chest xray suggets Obstructive emphysema left side

Pnumonia: H/o fever, cough, tachypnea, chest retractions, sick looking child, Chest xray shows consolidation
Brochiectasis: Chronic course, copious frothy sputum

Reference: Ghai 9th ed pg 390

Q. A child is brought to the pediatric OPD with high grade fever of 24 hours duration. History reveals 3 episodes of chest infection and passage of foul smelling stools. The most probable diagnosis is:

A. Cystic fibrosis
B. Maple syrup urine disease
C. Bilirubin conjugation defect
D. Criggler Najar syndrome

Answer: A

Solution

High grade fever and recurrent chest infection along with passage of foul smelling stools (steatorrhea) suggests a diagnosis of cystic fibrosis.

Cystic fibrosis:

- Autosomal recessive disease
- Mutation in cystic fibrosis transmembrane conductor regulator (CFTR) gene on chromosome 7q
- C/F's:
  - Recurrent respiratory infections
  - Azoospermia and infertility
  - Exocrine pancreatic insufficiency causing steatorrhea
  - Recurrent acute/chronic pancreatitis
  - Biliary cirrhosis
  - Failure to thrive
  - Salt depletion
  - Vitamin deficiencies

Maple syrup urine disease (MSUD):

- Autosomal recessive
- Disorder of branched chain amino acid due to deficiency of alpha keto acid dehydrogenase
- C/F's:
  - Neonates: Poor feeding, ketonuria, irritability, progressive encephalopathy, apnea, hypertonia
  - Chronic forms: Developmental delay, seizures, failure to thrive, movement disorders
  - Sweet Mousy odour of maple syrup in body fluids (Typical urine smell by 5-7 days)
- DNHP test and ferric chloride test done for diagnosis

Criggler Najar syndrome:

- -2 types- type I and II
- Defect in UDPGT enzyme (Glucuronyl transferase deficiency)
- Results in unconjugated hyperbilirubinemia

Bilirubin conjugation defect: Results in unconjugated hyperbilirubinemia

Reference: Nelson's 20/e p 2098-2112, Ghai 9/e p 392

Q. 5 years old child presents to the hospital with respiratory distress developed after swallowing a coin. Chest X-ray reveals the presence of coin in the bronchus. Which of the following is the next step in this patient?

A. Rigid bronchoscopy
B. Observe for the next 24 hours
C. Flexible endoscopy
D. Direct laryngoscopy

Answer: A

Solution

The child has already been diagnosed with a bronchial foreign body. Hence next step would be its removal and treatment of choice in a child with a foreign body in the bronchus is **Rigid bronchoscopy.**

Reference: Nelson's 20/e p 2040, Ghai 9/e p 390

58 BRONCHIAL ASTHMA

Definition: It is a chronic inflammatory disorder of airways, characterized by airway hyperresponsiveness, leading to recurrent episodes of reversible airway obstruction causing respiratory symptoms like wheezing, cough, shortness of breath, chest tightness.

Types 00:03:15

- Atopic type: more common
  - Associated with allergic rhinitis, atopic dermatitis
- Non atopic type: triggered by viral respiratory infections, cold air, exercises

Etiology 00:05:22

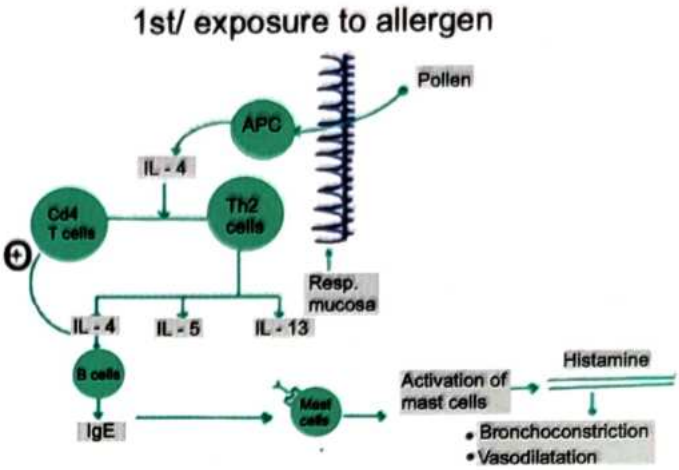
1. Genetic factors
- Chr 5 : IL4, IL 5, IL 13
- Polymorphisms of ADAM 33: proliferation of smooth muscles
- Beta 2 adrenergic receptor gene variant
- IL 4 receptor gene variant

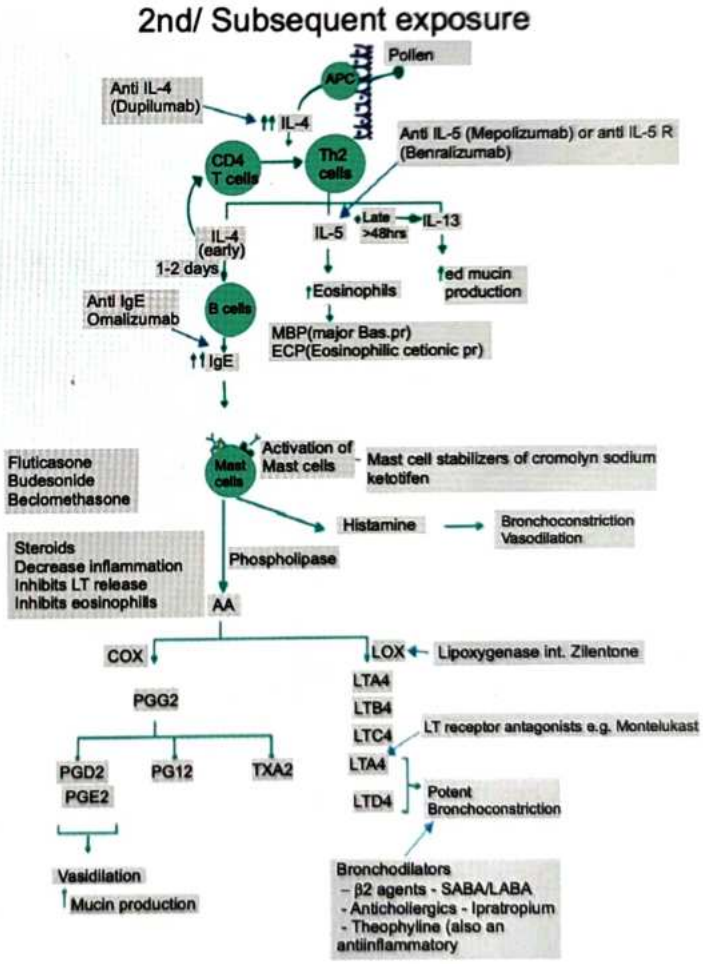
2. Environment factors
- Hygiene hypothesis: childhood exposure to germs & infections helps immune system to develop
- Dust, animal danders, smoke

3. Prenatal risk factors
- Maternal malnutrition
- Maternal smoking
- Maternal infections
- Stresses
- Use of antibiotics

Triggers
- Viral resp. infections
- Exposure to animals, dust, moulds, pollens
- Smoke: challah/incense sticks/tobacco
- Air pollutants/aerosols
- Drugs: aspirin, beta blockers (cause bronchospasm)

Pathophysiology





Clinical Features

- Classical symptoms: cough, shortness of breath, wheeze, chest tightness
  - More at night or early morning
  - Triggered by allergens, exercise, cold air
  - Worsened with viral resp. infections
- Severe disease: cyanosis, altered sensorium
- Signs of allergic disease:
  - Skin rashes: eczema, atopic dermatitis
  - Dennie lines: B/L lower eyelid skin folds
  - Allergic salute: nasal crease
  - Allergic shiners: dark circles/ pigmentation under eyes due to congestion of nose& sinuses
  - Mouth breathers: rhinitis with nasal polyps, enlarged adenoids, DNS

Respiratory Examination

- Severe cases: pulsus paradoxus
- Inspection
  - Signs of increased work of breathing
  - Hyperinflated chest
  - Tripod positioning
  - Grunting
  - Inability to speak full sentences
  - Cyanosis
- Percussion
  - Hyperresonant chest
- Auscultation
  - Prolonged expiration with wheezing

Investigations 00:40:10

- Pulmonary function tests (PFTs) or spirometry
  - Possible only in children < 5 yr age
  - Evidence of variable expiratory airflow limitation
  - FEV1/FVC :low(80%)
  - Bronchodilator responsiveness or reversibility: FEV1 increases by 12% of baseline value after inhaling a bronchodilator
  - FEV1 increases by > 12% of predicted after 4 weeks of anti inflammatory therapy
  - Average diurnal variability of PEFR(peak expiratory flow rate) >13%
- Peak expiratory flow meters

  - Portable, hand held, economic devices
  - Used at home for monitoring expiratory airflow obstruction
  - Fall of 20-30% from baseline: impending/ current exacerbation

D/D of bronchial asthma

- Young infants: GERD, aspiration, bronchiolitis
- 6 months to 3 yrs: bronchiolitis, transient wheezers, FB aspiration, CHD
- > 3 years: transient wheeze, CHD

Treatment of asthma in children

- Identify & eliminate exacerbating factors
- Education of patients & parents
- Pharmacological therapy (Reliever& controller)

A&B

- House should be kept clean & dust free
- Wet mopping of floor & other items should be done
- Carpets, curtains, stuffed furniture- should be cleaned periodically
- Adolescent patients & parents to refrain from smoking
- Avoid strong odours: incense sticks, perfumes, wet odour
- To avoid areas that were unoccupied & closed for some days

C. **Pharmacogical treatment**

1. Classify severity
2. Assess risk of exacerbation
3. Select medication
4. Select appropriate device & route
5. Follow up

1. Classification of asthma severity

Refer Table 58.1

2. Assess risk of exacerbation

- Uncontrolled asthma symptoms
- Medication related: ICS not prescribed, poor technique, poor compliance, high SABA use
- Co- morbidities: obesity, GERD, sinusitis, food allergies
- Exposure to smoke
- Socio economic issues
- Blood/ sputum eosinophilia
- Ever been to ICU or intubated for asthma

3. Stepwise approach to treatment

- In each step: avoid/ control triggers
- Reliever medication in all steps inhaled beta agonists eg, salbutamol
- Stepwise controller medication

- Step 1: As per latest GINA (global initiative for asthma, 2019), all patients of asthma should receive ICS, either symptom driven or daily (because SABA doesnot protect against severe exacerbation & regular/ frequent use of SABA increases risk of exacerbation)
- Step 2: Daily low dose ICS or daily LTRA
- Step 3: Daily low dose ICS+LABA or daily LTRA + low dose ICS or medium dose ICS
- Step 4: Medium dose ICS+ LABA or high ICS or add on ipratropium or LTRA
- Step 5: High dose ICS +LABA
  → Refer for phenotypic assessment & add on treatment
  → Oral low dose steroid

- **SABA** - Short acting β agonist
- **L–ICS** - Low dose inhalational corticosteroid
- **M–ICS** - Medium dose inhalational corticosteroid
- **H–ICS** - High dose inhalational corticosteroid

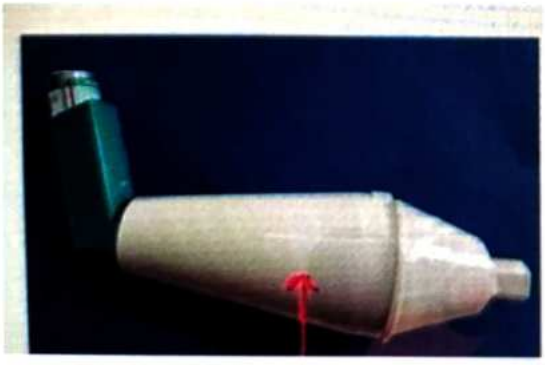
4. Devices used

a. Metered dose inhaler (MDI)

- Blue: bronchodilator
- Red: steroid

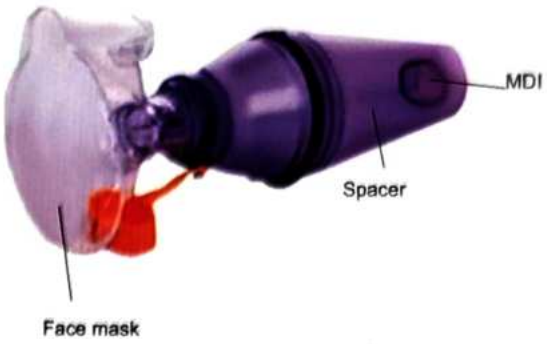
b. MDI + spacer

- Lesser coordination required
- Less impaction of drug in oropharynx



c. Using a mask

- MDI + spacer + baby mask: in children < 4 yrs



5. Follow up

- Assess technique on each visit
- Check for drug compliance
- Check asthma symptoms daily
- Classify into well/ partially/poorly controlled

Previous Year's Questions

Q. All are indicative of pediatric asthma except? (AIIMS June 2020)

A. Increase in FEV1 more than 15% after bronchodilator
B. AM:PM variation in FEV1 more than 15%
C. FEV1 decreases more than 15% after exercise
D. FEV1/ FVC less than 80%

Table 58.1

Severity	Day time symptoms	Night time symptoms	FEV_1	No. of acute exacerbation/ year
Intermittent	< 2/ week	< 2 month	> 85%	1/year
Mild persistent	> 2/ week but not daily	3 – 4/ month	> 80%	2/ year
Mod persistent	Daily	> 1/ week	60 – 80%	
Severe persistent	Continuous	More frequent	< 60%	

CLINICAL QUESTIONS

Q. A 9-year-old boy came to OPD with well-controlled, moderately persistent asthmA. He is taking short-acting beta-agonists, daily inhaled steroids, and a leukotriene inhibitor. He is now complaining of white patches on his buccal mucosA. Next best step is?

A. HIV testing
B. Rinse his mouth after use of inhaled medications
C. Measurement of serum immunoglobulins
D. Discontinuation of all his asthma medications

Answer: B

Solution

As the patient has moderately persistent asthma, he must be taking Inhaled steroids. Habit of failure to rinse his mouth after taking Inhaled steroids leads to Oral Candida infection (Thrush).

- The most commonly encountered adverse effects of Inhaled Cortocosteroids (ICS) are: oral candidiasis (thrush) and dysphonia (hoarse voice).
- Thrush results from propellant-induced mucosal irritation and local immunosuppression
- These adverse effects are dose-dependent and are most common in individuals receiving high dose ICS.
- These effects can be minimized by:
  - Using a spacer with an MDI because spacers reduce oropharyngeal deposition of the drug and propellant.
  - Mouth rinsing using a "swish and spit" technique after ICS use.

Reference: Nelson Textbook of Pediatrics 20th edition/ page 1107-1108

Q. 3 years old child presents to the hospital with respiratory distress. Patient Oxygen saturation remains 95%, BP- 110/80 mmHg. On auscultation, the patient presents with wheezing sounds. Which of the following inhalational treatment method is preferred for this age group?

A. MDI with spacer with face mask
B. MDI with spacer preferred
C. Only MDI directly
D. Rotacap

Answer: A

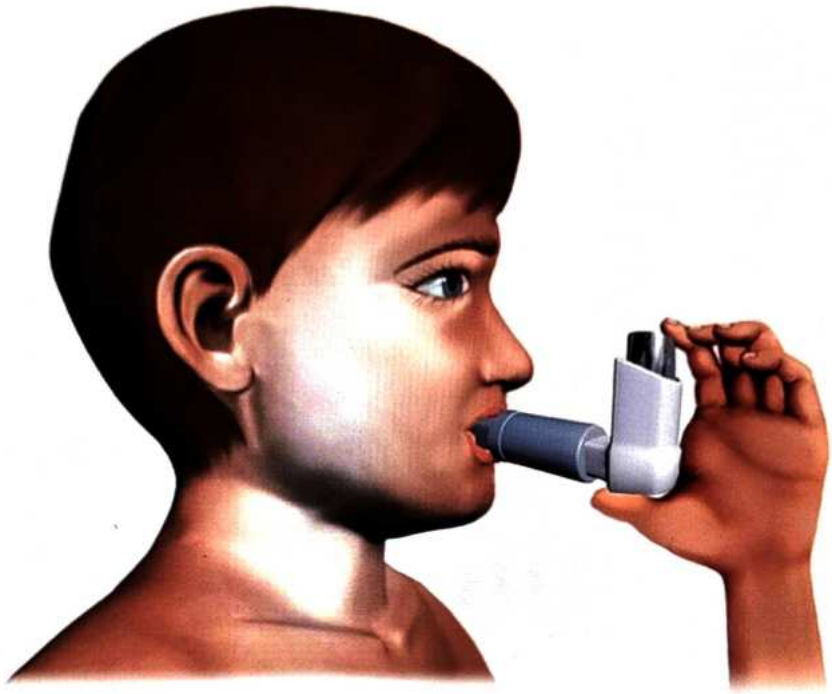
Solution

Wheezing sound describes the presence of bronchial asthmA.
Inhalation method should be chosen on individual basis, but a guideline is as follows:-

- Children <4 years old: - MDI with spacer with face mask
- Children >4 years old:- MDI with spacer preferred
- Children >12 years old: MDI used directly
- Use of spacer improves drug deposition.

Reference: Ghai, 9th edition, Chapter - 15, Page - 387

Q. Identify the following device prescribed for administration of beta agonist to a 5-year child with moderate persistent asthma:



A. Rotahaler
B. Metered dose inhaler with spacer
C. AMBU
D. T-piece

Answer: B

Solution

The device is a metered dose inhaler with a spacer- used in asthma to deliver inhaled short acting beta agonists/inhaled steroids

Inhalation method should be chosen on individual basis, but a guideline is as follows:

- Children <4-year-old: MDI with spacer with face mask
- Children >4-year-old: MDI with spacer preferred
- Children> 12-year-old: MDI used directly

AMBU (Artificial Manual Breathing Unit): Self inflating bag used to provide positive pressure ventilation during rescusitation

T-Piece: T-shaped tubing connected to an endotracheal tube; used to deliver free flow oxygen to an intubated patient who does not require mechanical ventilation.

Rotahaler: Dry powder inhaler (DPI); it is a breath activated device that can be used in children above 4-5 years olD.

Reference: Ghai 9th ed pg 386-387

59 INFECTIONS OF AIRWAYS & LUNGS

- Common cold
- Acute pharyngitis
- Acute Epiglottitis
- Acute laryngotracheobronchitis
- Acute Bronchiolitis
- Pneumonia

Important Information

MC case of acute coryza/common cold in children: Rhinovirus

ACUTE PHARYNGITIS

00:01:17

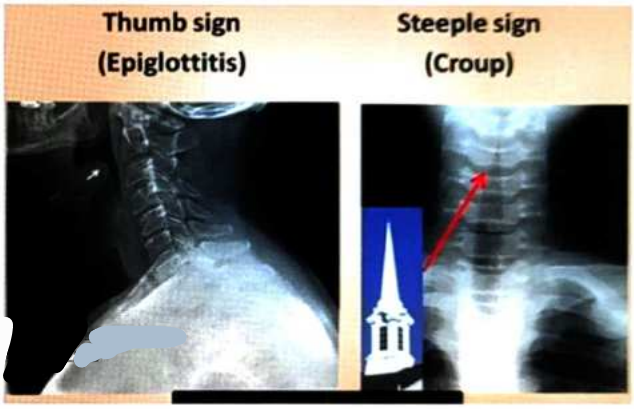
- MC cause in children: Streptococcus pyogenes
  - Viral cause: Adenovirus
- When to suspect streptococcal pharyngitis
  - Acute onset pharyngitis
  - High grade fever
  - Tonsillar exudates
  - Palatal Petechiae
  - Tender cervical lymphadenopathy
- **Diagnosis**: Throat swab RADT (Rapid Ag Detection test) or Culture
- **Treatment**: Penicillin / amoxicillin for 10 days
- **Complications**

	Prevention by Antibiotics
Peritonsillar abscess	Yes
Acute Rheumatic fever	Yes
Acute post streptococcal GN	No

- Antibiotics also prevent transmission of infection to others
- Antibiotics given how many days within the onset of illness of streptococcus pharyngitis prevents rheumatic fever: 9 days of onset.

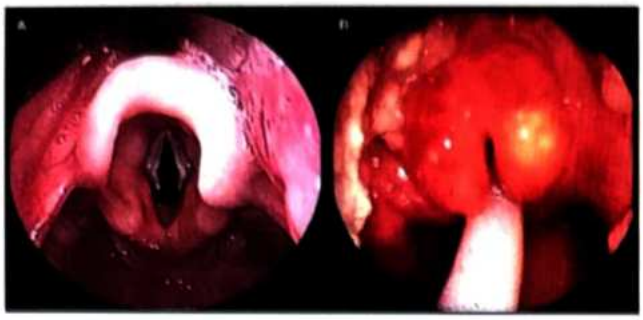
ACUTE EPIGLOTTITIS

00:08:12



- MC organism responsible
  - Previously, H influenza type b (Unvaccinated)
  - In Vaccinated children, currently
    - → streptococcus pyogenes
    - → streptococcus pneumonia
    - → Staph aureus
- **Clinical features**
  - Acute onset high grade fever
  - Throat pain
  - Drooling of saliva
  - Respiratory distress
  - Muffled voice
  - Stridor
- **Diagnosis**
  - 'Cherry Red' Epiglottis on laryngoscopy
  - 'Thumb sign' on lateral X-ray neck

- **Treatment**
  - Supportive care + IV 3rd generation cephalosporin for 7-10 days



Previous Year's Questions

Q. A child presents with high grade fever, stridor and develops swallowing difficulty with drooling of saliva. Along with airway management, which of the following is given? (AIIMS June 2020)

A. IV antibiotics
B. Steroids
C. Nebulized racemic epinephrine
D. Diphtheria antitoxin

ACUTE LARYNGOTRACHEOBRONCHITIS (CROUP)

00:12:34

- MC ORGANISM: Parainfluenza virus
- **Clinical features**: Starts with a viral prodrome & progresses to stridor, barking cough& respiratory distress. It has lesser acute onset & less severe course than acute epiglottitis
- **Diagnosis**: CXR 'STEEPLE SIGN'due to narrowing of upper airway
- **Treatment**
  - Supportive care, including O_2
  - Single dose dexamethasone – Oral / IM
    - → Effective, even in mild cases
    - → Reduces the need & duration of hospitalization
  - Moderate to Severe cases (Stridor at rest, Hypoxia, severe respiratory distress)
    - → Supportive care + single dose dexamethasone + Nebulized Epinephrine is used
- Antibiotics are not recommended as it is viral illness

Previous Year's Questions

Q. Steeple sign is seen in? (JIPMER Nov 2018)

A. Influenza
B. Croup
C. Laryngomalacia
D. Acute epiglottis

ACUTE BRONCHIOLITIS

00:17:47

- MC age group: 6 months – 2 years
- MC agent – RSV (Respiratory syncytial virus)
- Other etiological agents – Influenza Virus, parainfluenza virus, Adenovirus
- **Clinical features** Viral prodrome (low grade fever) f/b tachypnea, retractions & hypoxemia
- **O/E:** Hyperinflated chest & audible wheeze & Crepitation
- **Treatment**
  - Supportive: Moist O_2, IV fluids
  - Specific Rx: Nebulized Ribavirin indicated only in immunocompromised children& infants on ventilator
- **Prevention**: Palivizumab (in high risk situations)

Previous Year's Questions

Q. In exhausted child with severe bronchiolitis, for every 10 mm Hg increase in PCO2, how many millieq of bicarbonate will increase? (JIPMER Nov 2018)

A. 2
B. 4
C. 8
D. 1

PNEUMONIA

00:21:22

- It is leading infectious cause of death in children, worldwide accounting for 15% of all deaths of under 5 children
- MC cause of bacterial pneumonia in children: Streptococcus Pneumoniae
- 2ND MC cause of bacterial pneumonia in children: H. Influenza
- MC cause of viral pneumonia in children: RSV (Respiratory Syncytial Virus)
- MC cause of pneumonia in neonates: GBS > E.Coli
- MC cause of pneumonia in infants with HIV: Pneumocystis jiroveci

APPROACH TO A CHILD COUGH OR DIFFICULTY IN BREATHING

00:24:14

- Latest IMNCI [integrated management of neonatal & childhood illness] guidelines

Assess

- Count breath in 1 minute
- Look for chest indrawing
- Look & listen for stridor & wheeze
- Look for any danger sign

Fast Breathing

- < 2 months -> 60/min
- 2-12 months -> 50/min
- 1-5 years -> 40/min

General Dangerous Signs

- Persistent vomiting
- Unconsciousness
- Convulsions
- Inability to drink or breast feed
- Lethargy
- If wheezingis there along with fast breathing & chest indrawing, give a trial of rapid acting Inhaled Bronchodilatorsupto 3 times 15-20 min apart & reassess for fast breathing & chest indrawing.

Previous Year's Questions

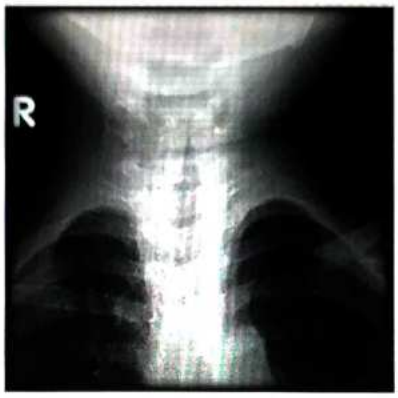
Q. When can one diagnose acute respiratory distress in a child? (NEET Jan 2018)

A. within 7 days of known insult
B. respiratory failure not fully explained
C. no left ventricular dysfunction
D. all of the above

Signs	Classify as	Treatment
• Any general danger sign or stridor in a calm child	• Severe Pneumonia or Very Severe Disease	• Give 1st dose of Inj Ampicillin & Gentamycin & refer urgently to hospital
• Either chest indrawing or fast breathing	• Pneumonia	• Give oral Amoxycillin x 5 days • If wheezing present, inhaled bronchodilator x 5days • Soothe the throat & relieve cough with a safer remedy • If cough > 14 days or recurrent wheeze → refer for evaluation of TB or bronchial asthma • Advise the mother when to return immediately • Follow up in 2 days • if the o saturation <90% → refer urgently
• No signs of pneumonia or very severe disease	• No Pneumonia or cough or cold	• Steps 2 to 5 plus follow up in 5 days

CLINICAL QUESTIONS

Q. The following sign on X ray neck is seen in which of the following diseases?



A. Acute epiglottitis
B. Laryngotracheobronchitis
C. Laryngomalacia
D. Acute Bronchiolitis

Answer: B

Solution

The given x ray shows 'Steeple sign' due to subglottic narrowing which is characteristically seen in Acute Laryngotracheobronchitis (Croup).

- Acute epiglottitis- shows thumb sign on lateral X-ray neck.

Acute Laryngotracheobronchitis (Croup):

- MC organsim: Parainfluenza virus
- C/F's: Starts as viral prodrome and progresses to stridor, barking cough and respiratory distress
- x ray shows 'Steeple sign' due to subglottic narrowing
- Treatment:
  - Oxygen support
  - Mild cases: Single dose dexamethasone
  - Moderate to severe cases: Supportive care + Single dose dexamethasone + Nebulized epinephrine

Acute Epiglottitis:

- Organisms responsible: Strep. pyogenes, Strep. pneumoniae, Staph. aureus, H. influenzae
- Clinical features:
  - Acute onset
  - High grade fever
  - Throat pain
  - Drooling of saliva
  - Muffled voice
  - Respiratory distress
  - Stridor
- Diagnosis: Cherry red epiglottis on laryngoscopy and thumb sign on lateral x-ray

- Treatment: Supportive care + 3rd generation cephalosporins for 10 days

Acute Bronchiolitis:

- Age group 6 months to 2 years.
- MC agent is RSV
- Clinical features: Viral prodrome followed by tachypnea, retractions and hypoxemia, wheeze and crepitations heard on examination
- Chest xray: Hyperinflated chest
- Treatment: Moist Oxygen
- In immunocompromised children and those on ventialtor: Nebulized Ribavirin is indicated

Laryngomalacia:

- Most common cause of stridor during infancy
- Stridor is inspiratory, low-pitched, and exacerbated by any exertion: crying, agitation, or feeding
- The diagnosis is confirmed by flexible laryngoscopy- Omega shaped epiglottis seen
- Treatment: Observation; resolves in most children by 2 years of age

Q. A child with fever and barky cough presented to emergency at 3 am. His respiratory rate is 36/min, stridor only on crying, fever 39 degrees celsius, no other abnormality.What is the next logical step?

A. Racemized epinephrine nebulisation
B. Dexamethasone
C. Do nothing, just reassure
D. Give surfactant

Answer: B

Solution

This child is suffering from Croup (Laryngotracheobronchitis): mild variety.

Oral/IM Dexamethasone (single dose) are beneficial in mild croup, as measured by reduced need and duration of hospitalization.

Nebulized epinephrine is indicated in moderate to severe croup (stridor at rest, the possible need for intubation, respiratory distress, and hypoxia)

Antibiotics are not indicated in croup as it is a viral disease.

Acute Laryngotracheobronchitis (Croup):

- MC organsim: Parainfluenza virus
- C/F's: Starts as viral prodrome and progresses to stridor, barking cough and respiratory distress
- Chest x ray (AP view) shows 'Steeple sign' due to subglottic narrowing
- Treatment:
  - Oxygen support
  - Mild cases: Single dose dexamethasone
  - Moderate to severe cases: Supportive care + Single dose dexamethasone + Nebulized epinephrine

Reference: Ghai Pediatrics 9/e p377, 398; Nelson 20/e p 2032-2034

LEARNING OBJECTIVES

UNIT 17: PEDIATRIC NEPHROLOGY

- Normal structure and function of kidney
- Acute & chronic kidney disease
  - AKI, its staging, types, diagnosis, treatment
  - HUS
  - RVT
  - CKD, staging, etiology, C/F, diagnosis, treatment
- Congenital abnormalities of GUT
  - Normal renal development
  - Various renal abnormalities
- Nephritic and nephrotic syndromes
  - Types of both in detail
  - Treatment of nephrotic syndrome
- Obstructive & infective disorders of urinary tract
  - Obstructive uropathies
  - UTI
- RTA
  - Proximal RTA
  - Distal RTA

60 NORMAL STRUCTURE AND FUNCTION OF KIDNEY IN CHILDREN

STRUCTURE OF KIDNEY

	Length of kidney	weight of kidney
Newborn	6 cm	24 gm
Adults	>/= 12 cm	150 gm

- In humans, formation of nephrons is complete by 34-36 weeks of gestation
- Approximately, 1 million nephrons in each kidney.
- There is functional maturation & tubular growth till the kidney continues to grow (till 18-20 years)
- Any disease leads to progressive loss of nephrons: renal insufficiency

FUNCTION OF KIDNEY

- Function of kidney is best assessed by GFR
- Glomerular filtration begins at 6 weeks of gestation
- After birth, GFR increases till renal growth ceases.
- To compare GFR in children & adults, GFR is standardized to body surface area ($1.73m^2$ of a 70 kg adult)
- Even after correction for BSA, GFR doesnot reach adult value until 2-3 yr of age

Age	Normal GFR (ml/min/1.73m2 BSA)
Preterm neonate	10
Term neonate	20-40
2-3 year	120 (adult value)

- Ways to assess kidney function

1. BUN level: affected by hydration & nitrogen balance of body
2. Creatinine level: depends on muscle mass & GFR (renal function may fall by 50 % before significant rise in creatinine)
3. Cystatine
4. Inulin clearance

- Bedside assessment of GFR: Schwartz formula

$$eGFR = \frac{K \times Ht\ (cm)}{Serum\ creatinie\ (mg/dl)}$$ where k= 0.413 in children

- Urine concentrating ability

Urine concentrating ability (mosm/kg)	
Preterm	500
Term	500-700
1 year	1200-1400 (adult value)

- Normally, small plasma molecules E.g., electrolytes, glucose, phosphate, urea, creatinine are freely filtered across the glomerulus, while larger molecules eg., albumin, globulin are retained in circulation.

61 ACUTE & CHRONIC KIDNEY DISEASE

ACUTE KIDNEY INJURY

00:00:20

Definition: Abrupt loss of kidney function, such that

- Increase in serum creatinine by ≥0.3 mg/dl from baseline within 48 hours

or

- Increase in serum creatinine by ≥ 50% within prior 7 days

or

- Urine volume ≤ 0.5ml/kg/hr from ≥ 6 hrs

KDIGO staging of AKI

00:04:20

(KDIGO: Kidney disease improving global outcomes)

Stage	Serum creatinine	Urine output
1	• ≥ 0.3 mg/dl increase or 1.5-1.9 times baseline	• < 0.5 ml/kg/hr for 6-12 hrs
2	• 2-2.9 times baseline	• < 0.5 ml/kg/hr for ≥ 12 hrs
3	• ≥ 3 times baseline (or) serum creatinine ≥ 4 mg/dl (or) indication of RRT (dialysis) (or) eGFR < 35 ml/min/1.73m^2	• < 0.3 ml/kg/ml for ≥ 24 hrs (or) Anuria for ≥12 hrs

Types of AKI & its Etiology

00:10:46

1. Prerenal AKI
2. Intrinsic Renal AKI
3. Post Renal AKI

1. Prerenal AKI

- Due to diminished effective circulating blood volume
- Inadequate renal perfusion: Decreased GFR
- Example
  - Dehydration (Diarrhea)
  - Hemorrhage
  - Cardiac failure
  - Burns
  - Sepsis

2. Intrinsic Renal AKI

- Due to Renal Parenchymal damage by Hypoxia / Ischemia & nephrotoxic insults
- Example
  - Glomerulonephritis (PSGN, LUPUS, HSP)
  - Hemolytic Uremic Syndrome (HUS)
  - Renal vein thrombosis
  - Toxins & Drugs Eg: Aminoglycosides, Amphotericin B vancomycin, cisplatin, cyclosporine
  - Tumor infiltration
  - ATLS
  - Snake bite

3. Post Renal AKI

- Obstruction of Urinary tract
- Relief of obstruction leads to recovery of Renal function except in associated renal dysplasia (or) Prolonged obstruction
- Example
  - Posterior urethral valve
  - B/L Pelvic-Ureteric 3unction obstruction
  - Urolithiasis
  - Abdominal tumors
  - Neurogenic bladder

Diagnosis

00:20:13

- History of AKI in an infant with vomiting & Diarrhea 'Prerenal AKI'
- Male neonate with B/L Hydronephrosis & Palpable urinary bladder PUV
- 6-7yr old with pharyngitis, Edema, Hypertension 8 Hematuria Acute Glomerulonephritis
- Critically ill child on multiple drugs Acute tubular Necrosis

Lab parameters	Pre renal KAI	Renal AKI
Urine specific Gravity	>1.020	<1.010
Urine osmolality	>500 mosm/kg	< 350 mosm/kg
Urine Na	>20 meq/L	>40 meq/L
Fractional excretion of sodium (FeNa)	<1% (<2.5% in neonates)	>2% (>10% in neonates)

Complications of AKI

00:28:20

- Metabolic
  - Hyperkalemia – Arrthymias
  - Metabolic Acidosis
  - Hypocalcemia
  - Hyponatremia
  - Hyper phosphatemia
- Cardia pulmonary
  - Pulmonary edema
  - Heart failure
  - Severe hypertension
- Hematologic:
  - Anemia
  - Bleeding
- Neurologic:
  - Irritability
  - Seizure
  - Encephalopathy

Treatment of AKI

00:32:10

- Monitor urine output (Bladder catheterization)
- Relieve urinary obstruction (If any)
- If no fluid overload (or) Heart failure then fluid challenge NS 20ml/kg over 30 mins
- Diuretics considered after ensuring adequacy of circulating blood volume , If no response to diuretics→ stop
- Patients with normal intravascular volume fluid is given in 24 hrs called AKI regime
  - Insensibie loss + Replacement of urine output volume by volume

  ↓

  (400ml/m^2/24 hrs)
- Avoid & stop any nephrotoxic drugs if possible or modify their dosage

Treatment of complications

00:38:20

Hyperkalemia	• IV Gluconate, IV NaHCO3, Inj insulin Dextrose
Metabolic Acidosis	• Give NaHCo3 only if PH < 7.15 (or) HCO3 level < 8mEq/L
Hypocalcemia	• Decrease phosphate levels ± IV calcium
Hyponatremia	• Restriction of fluid ± Hypertonic saline if symptomatic (or) very severe
Hypertension	• Anti-hypertension Eg: Amlodipine, Labetolol

Renal replacement Therapy (RRT)

00:41:52

- Indications
  - Volume overload with pulmonary Edema
  - Refractory Hyperkalemia
  - Severe refractory Metabolic acidosis
  - Uremic encephalopathy/pericarditis
- Modalities of RRT
  - Intermittent Hemodialysis: Hemodynamically stable patients
  - Peritoneal Dialysis: neonates & infants
  - Continuous Renal Replacement Therapy (CRRT): Preferred in Hemodynamically unstable critically ill patients in ICU setting

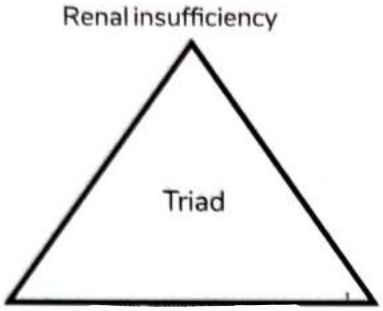
CRRT Machine

Hemodylasis machine Peridoneal dialysis

HEMOLYTIC UREMIC SYNDROME

00:53:44

- Most common Thrombotic Microangiopathy in children
- Endothelial injury in the causes of HUS

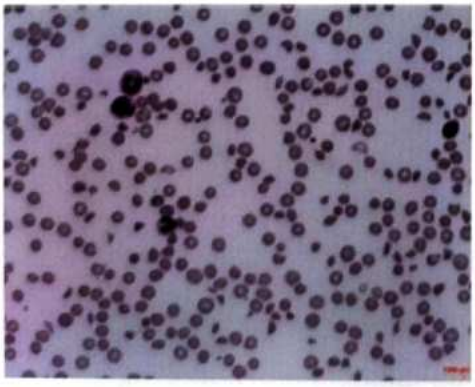


2 types of HUS

Classical (D HUS)	Atypical (D-HUS)
• Secondary to infection by shigatoxin producing E coli (0157:H7) or shigella dysentery	• Excess of activation or insufficient inhibition alternative complement pathway
• Secondary to infection by streptococcus pneumonia, malaria, HIV parvovirus	• E.g: Factor H deficiency factor, I deficiency, Anti-factor H Ab

Clinical features
- MC in preschool / school age children
- Onset 5-7 days after bloody diarrhea & Fever
- Sudden pallor, weakness, petechial, bleeding, Deceased urine output

Investigative findings
- Anemia-Rapidly progressive; increased LDH
- Thrombocytopenia
- Peripheral smear- schistocytes
- Urine- Microscopic hematuria & mild proteinuria
- Elevated urea/creatinine



Treatment of HUS
- RRT
- Plasmaphersis
- IVig
- Steriods
- Eculizimab (anti C5 Ab): blocks terminal complement pathway

RENAL VEIN THROMBOSIS (RVT) 01:02:41

- Begins in intra renal venous circulation
- **Occurs in**
  - Neonates/infants: Asphyxia, dehydration, shock, sepsis, central venous catheter
  - Older children: Nephrotic syndrome, (CHD, Hypercoagulable states sepsis)
- **Clinical features**
  - Sudden onset gross hematuria with unilateral (MC) (or) B/L flank masses
  - May present with Microscopic hematuria, flank pain hypertension
- **Diagnosis**
  - USG- Marked renal stenosis
  - Radio Nucleotide scan (DTPA)- Little (or) no filling in the affected kidney
  - Doppler of renal vein & IVC – confirm the diagnosis
- Treatment
  - **Supportive**
  - B/L Renal vein thrombosis: Tissue plasminogen activation and/or unfractionated heparin

CHRONIC KIDNEY DISEASE 01:07:30

Definition

A patient has CKD if either of the following is present:

1. Kidney damage ≥ 3 months as defined by structural or functional abnormalities of the kidney with / without decrease in GFR manifested by one of the following:
   - Any abnormalities in composition of blood (or) urine
   - Any abnormalities on imaging tests (or)
   - Abnormalities in kidney biopsy
2. GFR < 60 ml/min1.73 M^2 for > 3 months

Staging of CKD: 01:11:08

Stage	GFR (ml/min/1.73 m^2)
1	≥ 90
2	60-89
3	30-59
4	15-29
5	< 15 (or) on Dialysis

Etiology of CKD

01:12:13

Glomerular	Non glomerular
Door Camp	
D - Dysplastic kidney	Chronic glomerular nephritis
O - Obstructive uropathy	Alport syndrome
O - Oxalosis	Lupus nephritis
R - Reflux nephropathy	HUS
C - Cystinosis	HSP Nephritis
A - ARPKD, ADPKD	IGA Nephropathy
M - Medullary cystic kidney	MGN
P – Pyelonephritis	MPGN

Clinical features

01:15:33

Growth restriction (short stature)	• Anemia inadequate nutrition, • Renal osteodystrophy
Anemia	• Decreased Erythropoietin, • Iron & vitamin B12 deficiency
Bleeding	• Uremic platelet dysfunction
Infection	• Defective granulocyte function
Hypertension	• Volume overload, increase rennin production
Renal osteo-dystrophy	• Decreased calcitriol, hypocalcemia, hyperphosphatemia, Hyper para-thyroidism

Investigative findings

01:18:45

Increased urea & creatinine	• Decreased GFR
Hyperkalemia	• Decreased GFR, metabolic acidosis
Hyponatremia	• Solute diuresis
Metabolic acidosis	• Impaired HCO3 reabsorption, decreased acid excretion
Urine concentrating defect	• Solute dimesis & tubular damage

Treatment of CKD

01:20:40

- Supportive

Nutritional rehabilitation	• Adequate calories + Micronutrients
Treatment of anemia	• Inj Erythropoietin, Fe, Multivitamins
Anti- hypertensives	• ACE inhibitors, ARB's
Renal osteodystrophy	• Calcitriol
Phosphate binders	• Eg Caco3, Ca actetate
K+ binding resins	• Kayexalate
RX of metabolic acidosis	• Sodium Bicarbonate tablets

- Adjust drug according to GFR
- RRT
  - Intermittent HD
  - Continues Ambulatory Peritoneal dialysis
  - Renal transplantation

CLINICAL QUESTIONS

Q. 6 years old child brought to the hospital with decreased urine output associated with swelling of lower extremities. Blood examination reveals microangiopathic hemolytic anemia with thrombocytopenia. No past history of similar symptoms or any diarrheal episodes. You made a provisional diagnosis of atypical hemolytic uremic syndrome. Which of the following is the best treatment for this condition?

A. Plasmapheresis
B. Antibiotics
C. Ivlg
D. Dialysis
Answer: A

Solution

Best treatment of atypical HUS is- Plasmapheresis

- Repeated plasma exchange with an infusion of fresh frozen plasma is recommended for atypical HUS & performed daily until hematological remission

Hemolytic-uremic syndrome (HUS) is a common cause of community-acquired acute kidney injury in young children characterized by a triad of

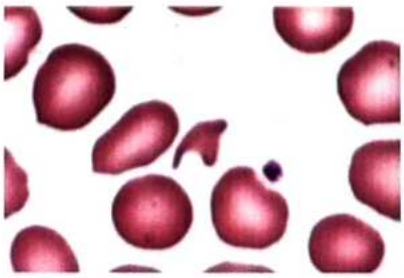
- Microangiopathic Hemolytic anemia
- Thrombocytopenia
- Renal dysfunction

Atypical HUS

- Often lacks the prodromal history of diarrhea or dysentery.
- Predisposing factors include mutations in regulators of the complement pathway (factors H, I and B, C3, membrane cofactor protein, and thrombomodulin), and antibodies against complement factor H.
- The diagnosis is made by the combination of microangiopathic hemolytic anemia with schistocytes, thrombocytopenia, and kidney involvement. Renal biopsy is rarely required.
- Treatment includes management of complications of renal failure, treatment of hypertension, and correction of anemia. Proper nutrition must be ensured. Repeated plasma exchange with an infusion of fresh frozen plasma is recommended for atypical HUS & performed daily until hematological remission.

Reference: Nelson's 20/e p 2508, Ghai 9/e p 488

Q. A 4 year old child presented with decreased urine output for last 20 hours & petechial spots over the body. There was a history of diarrhea 2 weeks prior to this. Blood investigations revealed a Hb level of 7 g/dl, TLC 11,800/mm3, Platelet count of 35,000/mm3. His peripheral smear fndings are shown below



What is the diagnosis?
A. Malaria
B. Idiopathic thrombocytopenic purpura
C. Acute tubular necrosis
D. Hemolytic uremic syndrome
Answer: D

Solution

Peripheral smear showing schistocytes in a child with oliguria, thrombocytopenia, anemia & a history of recent diarrhea suggest a diagnosis of Hemolytic uremic syndrome (HUS)

- **Shiga-toxin producing E. coli (STEC) and Shigella dysentriae type 1** are usual causes of HUS in children.
- Hemolytic-uremic syndrome (HUS) is a common cause of community acquired acute kidney injury in young children characterised by a triad of
  - Microangiopathic Hemolytic anemia
  - Thrombocytopenia
  - Renal insufficiency
- Laboratory findings: **low hemoglobin** level, **decreased platelet count**, hypoalbuminemia, and hemolysis on peripheral smear (burr cells, helmet cells, schistocytes)
- Urinalysis reveals hematuria and proteinuria.
- A marked reduction of renal function leads to oliguria and rising levels of blood urea nitrogen (BUN) and creatinine

Other options in the question:

Malaria- Presents with fever, chills & rigors, pain in limbs. Peripheral Blood Film shows malarial parasite.
ITP - comes with h/o fever, sudden appearance of bruises & mucosal bledding
Acute tubular necrosis- oliguria, edema, hypertension.

Reference: Nelson's 20/e p 2508? Ghai 9th ed/p- 487

Q. 10 years old child presents to the hospital with decreased urine output associated with lower limb swelling. To diagnose it as acute kidney injury, which of the following terms is correct?

A. Less than 0.3 ml/kg/hr for >6 hrs
B. Less than 0.5 ml/kg/hr for >6 hrs
C. Less than 0.8 ml/kg/hr for >6 hrs
D. Less than 1 ml/kg/hr for >6 hrs
Answer: B

Solution

Acute kidney injury (AKI) in children is defined:

- Increase in S. creatinine of >0.3 mg/dl over 48 hrs or
- Increase in S. creatinine 1.5-2 fold from baseline in last 7 days
- Urine output <0.5 ml/kg/hour for > 6 hours

Pediatric-Modified Rifle (pRIFLE) Criteria:

CRITERIA	ESTIMATED Creatinine clearance (eCCl)	URINE OUTPUT
Risk	eCCl decrease by 25%	<0.5 mL/kg/hr for 8 hr
Injury	eCCl decrease by 50%	<0.5 mL/kg/hr for 16 hr
Failure	eCCl decrease by 75% or eCCl <35 mL/min/1.73 m2	<0.3 mL/kg/hr for 24 hr or anuric for 12 hr
Loss	Persistent failure >4 wk	
End-stage	End-stage renal disease (persistent failure >3 mo)	

Comparison of RIFLE versus AKIN versus KDIGO criteria for AKI

Criteria	RIFLE Creatinine definition	Criteria	AKIN Creatinine definition	Criteria	KDIGO Creatinine definition	Urine output
Risk	>1.5 - fold increase from baseline SCr or decrease in GFR>25%	Stage 1	>0.3 mg/dL increase or>1.5 fold increase from baseline SCr within 48 hrs	Stage 1	>0.3 mg/dl increase within 48 hrs or 1.5-1.9 times baseline within 7 days	<0.5 ml/kg/h for >6 hours
Injury	>2 fold increase from baseline SCr or decrease in GFR>50%	Stage 2	>2 fold increase from baseline SCr	Stage 2	2.0 - 2.9 times baseline within 7 days	<0.5 mL/kg/h for 12 hours
Failure	>3 fold increase from baseline SCr or increase to>4 mg/dl or decrease in GFR >75%	Stage 3	>3 fold increase from baseline SCr or increase to>4.0 mg/dl with an acute increase of >0.5 mg/dl or the initiation of RRT	Stage 3	>3 times baseline within 7 days or increase to>4.0 mg/dL with an acute increase of >0.5 mg/dL or initiation of RRT	<0.3 mL/Kg /h for 24 hours or anuria for > 12 hours

**Scr- Serum Creatinine; AKIN: Acute Kidney Injury Network; KDIGO: Kidney Disease Improving Global Outcomes

Reference: Nelson's 20/e p 2540-2543, Ghai 9/e p 482

62 CONGENITAL ANOMALIES OF GENITO-URINARY TRACT

NORMAL RENAL DEVELOPMENT 00:00:30

- Begins in 5th week of Intrauterine life
- Ureteral bud arises from mesonephric (wolffian) duct and Penetrates metanephric Blastema
- Metanephric Blastema - Undifferentiated mesenchyme on nephrogenic ridge

UNILATERAL RENAL AGENESIS 00:01:59

- Absent kidney development
- Secondary to defect of wolffian duct / ureteral bud / Metanephric blastema
- Increased incidence in neonates with 'single Umbilical artery'
- Contralateral kidney undergoes compensatory Hypertrophy
- Absent ipsilateral vas deferens and contralateral vesico-ureteric efflux (VUR) associated
- In Females, Meyer Rokitansky kuster Hausen (MRKH) Syndrome: Vaginal aplasia, uterine Mal-development, normal ovaries) may be associated

Important Information

- **Renal Aplasia: A small lump a non-Functioning tissue is seen capping the ureter**

POTTER SYNDROME/SEQUENCE 00:06:46

- B/L renal agenesis (incompatible with life)
- Clinical features
  - **P** – **P**ulmonary Hypoplasia(MC cause of mortality in Potter syndrome)
  - **O** - **O**ligohydramnios
  - **T** – **T**wisted Facial Dysmorphism
  - **T** – **T**wisted skin (wrinkled skin)
  - **E** – **E**xtremities anomaly
  - **R** – **R**enal agenesis B/L (Primary anomaly)

How to remember

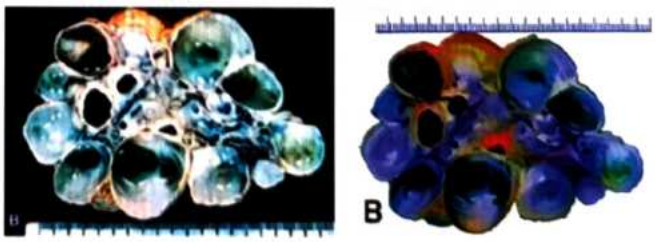
- POTTER

Potter facies

- Eyes widely separated
- Epicanthic folds
- Depressed Bridge of nose
- Low set ears
- Receding chin

MULTI CYSTIC DYSPLASTIC KIDNEY 00:11:14

- Entire kidney is dysplastic and replaced by multiple cysts of varying sizes and are non-functional
- Usually unilateral
- Non-Inherited disorder
- B/L MCDK is not compatible with life
- MCDK is the most common cause of abdominal mass in newborn.
- Increased risk of Wilm's tumor



ASK-UPMARK KIDNEY 00:14:02

- aka segmental Hypoplasia
- Kidneys with one or more deep groves on the lateral convexity under which parenchyma consists of tubules resembling those in thyroid gland

- Most patients have severe hypertension
  ↓
  May even require Nephrectomy

SIMPLE RENAL CYSTS

00:15:57

- Usually diagnosed incidentally
- Mostly Asymptomatic and No Rx required
- Further evaluation may be warranted for
  - Septations
  - Irregular margins
  - Cluster of cysts
  - Calcifications

HORSE SHOE KIDNEY

00:17:25

- Fusion of lower poles of both kidneys in midline
- Common in Turner syndrome
- Chances of Wilm's Tumor are 4 times more common than general populations
- Nephrolithiasis and hydronephrosis are important complications (dlt compression of ureters by isthmus)

AUTOSOMAL RECESSIVE POLYCYSTIC KIDNEY (ARPKD)

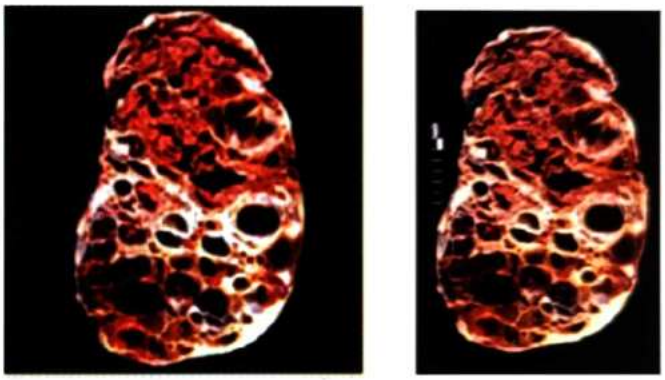
00:19:58

- Gene-PKDHI Gene (Polycystic kidney and Hepatic disorders)
- Fibrocystin-Autosomal recessive inheritance
- Both kidneys are markedly enlarged with innumerable cysts throughout cortex and Medulla
- M/E-Dilated ectatic collecting ducts which radiate from the medulla to cortex
- **Pathophysiology**
  - Progressive Interstitial fibrosis and tubular Atrophy
    ↓
    Renal Failure
  - Bile duct Proliferation and Ectasia leading to progressive Hepatic fibrosis
- **C/F**
  - Antenatal USG - Oligohydramnios & B/L enlarged kidneys
  - Infant
    a. B/L flank masses in early infancy, Respiratory distress, severe Hypertension, oliguria and AKI
    b. 50% develop ESRD (End Stage Renal Disease) by 10 years of age
  - Hepatic fibrosis: Portal Hypertension, varices, Hepatosplenomegaly, Ascending Cholangitis and thrombocytopenia
- **Investigation:** USG Abd Markedly enlarged and uniformly hyperechogenic kidneys with poor corticomedullary differentiation
- **Treatment:** supportive

AUTOSOMAL DOMINANT POLYCYSTIC KIDNEY DISEASE

00:30:09

- MC inherited kidney disease
- Multisystem disease (cysts in liver, pancreas, spleen and brain: saccular cerebral aneurysm)
- **Genes**
  - PKD Gene on ch16- polycystin (more severe)
  - PKD Gene on ch 4- polycystin z
- B/L enlarged kidneys with large cortical & Medullary cysts, arising from all regions of Nephron



- **Clinical features**
  - Symptomatic MC in 4th or 5th decade
  - Hematuria (gross or Microscopic)
  - B/L Flank pain
  - Abdominal mass
  - Hypertension
  - UTI may be seen in children
- **Dx:**
  - USG – B/L enlarged kidneys with Macrocysts in a patient with an affected 1st degree relative
  - Screening USG - may be normal in:
    → <20%. by 20yrs age
    → <5% 30yr age
- **Treatment**
  - Supportive
  - HTN treatment: ACE inhibitors, ARBs

NEPHRONOPHTHESIS

00:40:01

- NPHP 1-9 Genes (Nephrocystin-AR)
- Renal fibrosis, Tubular atrophy and Cyst formation
- One of the common causes for ESRD in children & Adolescents
- **C/F**

- Polyuria
- Failure to thrive
- Anemia
- Later Hypertension and edema
- ESRD

BLADDER EXSTROPHY

00:42:06

- M:F-2:1
- Severity: Epispadias (Male) to complete exstrophy of cloaca (exposure of entire hindgut and bladder)
- **C/F**
  - Urinary Bladder protrudes from Anterior abdominal wall and its Mucosa is exposed
  - Umbilicus displaced downwards
  - Pubic rami widely separated
  - Rectus Muscles separated
  - In males -Complete Epispadias, undescended testis, Inguinal Hernia common
  - Anus displaced anteriorly and/or Rectal prolapsed (both males and females)
- **Consequence**:
  - Total urinary incontinence
  - Increased Risk for bladder adenocarcinoma
- **Treatment**
  - Cover the defect with a plastic wrap to keep the Mucosa moist
  - Surgery

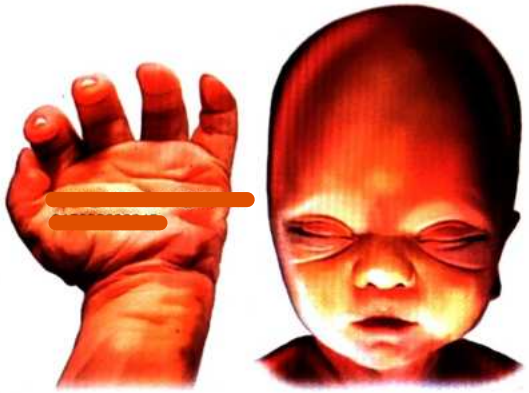
ECTOPIC URETER

00:48:37

- A condition where the ureter instead of terminating into the urinary bladder terminates at a different site.
- **Common sites**
  - Female: urethra, vestibule, vagina
  - Males: posterior urethra, prostatic utricle, seminal vesicle
- **C/F**
  - Incontinence/continuous dribbling of urine
  - Infections
  - Hematuria
  - Flank pain
  - Vaginal discharge

CLINICAL QUESTIONS

Q. Identify the underlying kidney abnormality in the fetus shown below:



A. Polycystic kidney disease
B. Multicystic dysplastic kidney
C. Renal agenesis
D. Nephronophthisis
Answer: C

Solution

A → Washerman's hand with wrinkled skin
B → Widely separated eyes with epicanthic folds, low set ears, flat nose & receding chin, s/o "Potter Facies"- seen in bilateral renal agenesis

Renal agenesis:

- Unilateral renal agenesis may occur sporadically or as part of syndromes such as brachio-otorenal, DiGeorge, Fanconi anemia, Fraser or nail-patella syndromes. Unilateral renal agenesis is asymptomatic, usually detected incidentally on ultrasonography.
- Bilateral renal agenesis is incompatible with extrauterine life and produces the Potter syndrome. The newborn has a characteristic facial appearance, termed Potter facies. Lack of fetal urine production leads to oligohydramnios and limb anomalies. Neonates with bilateral renal agenesis die of pulmonary insufficiency from pulmonary hypoplasia.

ADPKD (Autosomal Dominant Polycystic Kidney Disease):

- Caused by mutations in the ADPKD1 (chromosome 16) or ADPKD2 (chromosome 4) genes encoding polycystin 1 and 2,respectively.
- The condition usually presents beyond the third decade of life with episodic hematuria, hypertension, palpable kidneys and gradual decline in renal function.

ARPKD (Autosomal Recessive Polycystic Kidney Disease)

- Caused by mutation in PKHD-1 gene encoding fibrocystin or polyductin
- Characterized by fusiform dilation of collecting tubules which are arranged radially from the cortex to medulla.
- Affected children presents with palpable kidneys, oliguria, respiratory insufficiency, and portal hypertension due to associated **congenital hepatic fibrosis**.

Nephronophthisis:

- Autosomal recessive disorder with renal fibrosis, tubular atrophy, and cyst formation
- It is a common cause of ESRD in children and adolescents
- Associated external findings include
  - Retinal degeneration (Senior-Loken syndrome)
  - Cerebellar ataxia (Joubert syndrome)
  - Hepatic fibrosis (Boichis disease)
- Symptoms include polyuria, failure to thrive, anemia, hypertension and edema.

Multicystic dysplastic kidney (MCDK)

- MCDK is the most common cause of an abdominal mass in the newborn
- MCDK usually is unilateral and generally is not inherited.
- Sonography shows the characteristic appearance of a kidney replaced by multiple cysts and no identifiable parenchyma is present

Reference: Nelson 20/e 2554/ Ghai 9th ed/p- 500

Q. Baby born at 30 weeks to 18 years old primigravida of weight 2 kg, died after 48 hours. Apgar scores were 5 and 8 at 1 and 5 minutes. On autopsy, bilateral enlarged kidney with multiple radially arranged cysts were seen. Which of the following finding is expected to be associated with it?

A. Imperforate anus
B. Hepatic cyst and fibrosis
C. Absence of ureter
D. Holoprosencephaly
Answer: B

Solution

- In the given question, neonatal death along with the presence of bilaterally enlarged kidneys with multiple cysts indicate **ARPKD** (autosomal recessive polycystic kidney disease).

ARPKD:

- Caused by mutation in PKHD-1 gene encoding fibrocystin or polyductin is characterized by fusiform dilation of collecting tubules which are arranged radially from the cortex to medulla.
- Affected children presents with palpable kidneys, oliguria, respiratory insufficiency, portal hypertension due to associated **congenital hepatic fibrosis**.

ADPKD:

The autosomal dominant form (ADPKD) is caused by mutations in the ADPKD1 (chromosome 16) or ADPKD2 (chromosome 4) genes encoding polycystin 1 and 2,respectively, The condition usually presents beyond the third decade of life with episodic hematuria, hypertension, palpable kidneys and gradual decline in renal function.

Reference: Nelson's 20/e p 2513, Ghai 9/e p 502

Q. You were sitting in a Pediatric nephrology class. Your professor fashed a question and asked you to answer, "Which one of the following is the most common cause of abdominal mass in neonates"?

A. Neuroblastoma
B. Wilm's tumor
C. Distended bladder
D. Multicystic dysplastic kidneys

Answer: D

Solution

a. Neuroblastoma is the MC extra cranial solid tumor in children & most commonly diagnosed malignancy in infants
b. Wilm's tumor or Nephroblastoma is the most common primary malignant renal tumor of childhood and the second most common malignant abdominal tumor in childhood
c. Distended bladder: examination after voiding rules out swelling due to distended bladder
d. Multi cystic dysplastic kidney (MCDK) is the **most common cause of an abdominal mass in the newborn**, but the vast majority are non palpable at birth.

Reference: Nelson's 20/e p 2555, Ghai 9/e p 500

Q. A woman with no history of any prenatal care is going to deliver a baby. She has no history of amniotic rupture and ultrasound showed severe oligohydramnios. Which of the following conditions can be the cause of oligohydramnios?

A. Renal agenesis
B. Anencephaly
C. Trisomy 18
D. Duodenal atresia
Answer: A

Solution

- Oligohydramnios occurs due to congenital abnormalities of the fetal kidneys or genitourinary tract, such as renal agenesis or obstruction, that impede normal formation or excretion of fetal urine.
- Anencephaly, trisomy 18 and duodenal atresia causes polyhydramnios.

Reference: (8th Edition) [O.P. Ghai] page505

63 NEPHRITIC & NEPHROTIC SYNDROMES

NEPHRITIC SYNDROME

00:00:30

- **Definition**
  - Sudden onset of gross Hematuria & proteinuria, edema, Hypertension & Renal Dysfunction
  - Nephritic Range Proteinuria
- To detect proteinuria in children, take morning sample & do Urine protein: urine creatinine

Up: Ucr	Dipstick
<0.2 normal	nil or trace
0.2-2 Nephritic range Proteinuria	1 or 2+
>2 nephrotic range (or) massive proteinuria	≥ 3+

Important Information

- MC cause of Nephritic syndrome in children – PSGN (Post streptococcal Glomerulonephritis)
- It is one of the most common syndrome cause of gross hematuria in children

1. PSGN

00:06:50

- Follows infection by nephritogenic strains of group A β hemolytic streptococcus causing Pharyngitis (M1, 4, 25) (or) skin infection (M_{49})
- **Pathophysiology**
  - Deposition of immune complexes with streptococcal antigen & complement activation
  - Antibodies against them cross react with Glomerular antigens due to molecular mimicry
- **HPE**
  - **Light microscopy**: Neutrophilic infiltration in Glomeruli & diffuse mesangial proliferation
  - **Electron microscopy**: 'Sub epithelial humps" (below podocytes)
- **Clinical features**
  - MC age: 5-12 years
  - Symptoms usually appear 1-2 weeks after Streptococcal pharyngitis & 3-6 weeks after pyoderma
  - Nephritic picture: coca colored urine, edema, hypertension
  - Spectrum: Asymptomatic with microscopic Hematuria to acute kidney injury
  - Acute phase usually resolves in 6-8 weeks
- **Diagnosis**
  - Urine → RBC & RBC casts, Proteinuria
  - C_3 level ↓ in 90% of patients→ Normal in 6-8 weeks of onset
  - ↑ASO (Anti Streptolysin O) titer following pharyngitis
  - ↑Anti DNASe B following Pyoderma

  } Evidence of prior Streptococcal infection
- **Indications of Renal biopsy in PSGN**
  - AKI
  - Nephrotic presentation
  - Normal C_3 at the beginning
  - C/F &/or low C_3 levels persisting even > 2 months after onset
- **Treatment**
  - Early antibiotics do not eliminate the risk of glomerulonephritis
  - Salt & water restriction, Diuretics
  - Anti – hypertensive
  - Eg: Ca channel blockers, ACE inhibitors
- **Prognosis:**
  - Complete recovery seen in >95% children
  - Chronic Glomerulonephritis 2 -4 %
  - RPGN in 1%

2. Rapidly progressive glomerulo Nephritis (RPGN)

- Rapid loss of Renal function following GN
- **3 types**

I	II	III
Anti GBM Ab Mediated	**Immune complex mediated**	**Pauci Immune (ANCA +ve)**
• Good pastuer syndrome	• PSGN • IgA Nephropathy • HSP nephritis	• Churg strauss syndrome • Microscopic poly angiitis • Wegner's Granulomatosis

- **HPE**

Hallmark	• Epithelial Crescents (crescentric GN) involving ≥ 50% of glomeruli ↓ Later, fibrous crescents	• Proliferation of parietal epithelial cells of Bowman capsule.

- **Treatment**
  - Corticosteroids
  - Cyclophosphamide
  - Plasmapheresis

3. IgA nephropathy 00:28:24

- aka Berger's disease
- it is the MC chronic glomerular disease in children
- C/F: Males > Females
  - Gross Hematuria within 1-2 days following URI or GI infection
  - Many presents as nephritic syndrome/ Nephrotic syndrome/ combined nephritic & Nephrotic syndrome
  - Hypertension & Loin pain

- **Investigation**
  - **Urine**
    - → Hematuria & Proteinuria
    - → Serum C_3 level normal usually
  - **Kidney biopsy**
    - → Mesangial Proliferation & IgA deposits in mesangium
- **Treatment:** BP control (ACE inhibitors & ARB)
- **Prognosis:** Progressive disease in 20-30% adults, 15-20 years after onset

3. Alport syndrome

- aka Hereditary nephritis
- **Genetics:**
  - ~85% patients have x linked: COL_4A_5 Gene
  - ~15% patients have AR: COL_4A_3, COL_4A_4 Gene
- **Pathophysiology:** Mutation in Gene encoding type IV collagen which is an important component of Basement membrane

- **Clinical features**

Kidneys	Eyes	Ears
• Proteinuria • Hematuria	• Anterior Lenticonus (Pathognomic) • Corneal erosions • Macular flecks	• B/L – Sensory neural hearing Loss (not congenital) in 90% of males with X- linked disease

  - Others features
    - → Asymptomatic microscopic hematuria
    - → Single / multiple episodes of gross hematuria 1 – 2 days after URTI.
    - → Proteinuria is MC in males – By 2nd decade of life, many reach nephrotic range.
- **Diagnosis**
  - Family history
  - Screening urinalysis of 1st degree relative
  - Audiogram
  - Ophthalmic examination
- **Skin biopsy:**
  - Absent epidermal basement membrane staining for $_5$ chain of type IV collagen in Hemizygous males (Pathognomonic for X – linked Alport syndrome)
- **Kidney biopsy**
  - Light microscopy: progressive Glomerular Sclerosis, Tubular atrophy, Interstitial Inflammation
  - Electron Microscopy: "Basket weave appearance", Due to splitting of Glomerular basement membrane
  - Genetic Diagnosis: possible mutation in COL_4A_5 Gene
- **Treatment:** ACE inhibitors & ARBs
- **Prognosis**
  - Risk of end stage Renal disease is high among male Hemizygotes
  - ESRD seen at <30 years in 75% hemizygotes

NEPHROTIC SYNDROME 00:46:05

- Nephrotic range/massive proteinuria (Up: Ucr >2 or ≥ 3 protein on dipstick testing)
- Hypoalbuminemia
- Generalized edema (MC presenting symptom)
- Hyperlipidemia

Etiology

Refer Table 63.1

Congenital nephrotic Syndrome: 00:52:14

- Manifests at birth or within 1st 13 months of life

- **Genetic defects:**

Genes	Protein	Phenotype
NPHS1	Nephrin	Congenital nephrotic syndrome (finish variety)
NPHS2	Podocin	FSGS SRNS
NPHS3	PLCE1	SRNS (Steroid resistant nephrotic syndrome)
WTI	Diffuse mesangial sclerosis	

- **Syndromes associated with congenital nephrotic syndrome**

1. Denys Drash syndrome: WT1 gene
2. Frasier syndrome: WT1 gene
3. Pierson syndrome: LAMB 2 gene
4. Nail patella syndrome: LMX1B gene
5. Galloway Mowat syndrome

Important Information

- MC cause of Nephrotic syndrome in children – minimal change disease (in 2-6 yrs)
- Kidney biopsy
  - LM – Normal
  - EM – Effacement of foot process of Podocytes
- M/C cause of Nephrotic Syndrome in children: FSGS
- M/C cause of ESRD in Adolescent: FSGS

Previous Year's Questions

Q. A 3 yr girl with generalized edema, shortly after recovery from an upper respiratory infection. Lab studies reveal marked albuminuria, hypoalbuminemia & hyperlipidemia. Prior similar episodes responded to steroid. What is the diagnosis? (NEET Jan 2020)

A. FSGS
B. MGN
C. MCD
D. PSGN

Clinical features of nephrotic syndrome

1. Edema-Begins usually as puffiness around eyes

↓

Pedal edema (pitting)

↓

Generalized edema (MC presenting symptom)

↓

Anasarca (pleural effusion, Peritoneal collection)

2. Increased susceptibility to infections.

- Mainly by Encapsulated organisms Eg: Pneumococcus
- Cellulitis, SBP (Spontaneous Bacterial Peritonitis)
- Ig & complement factors lost in urine.

3. Hypercoagulability

- Increased risk of thrombosis
- Due to Hemoconcentration & vascular stasis, loss of protein S & AT III in urine
- **Investigations**
  - Morning urine sample-up: ucr >2 or ≥3 protein on dipstick
  - Low serum albumin: 2.5g/ml
  - Increased lipid levels (TG & cholesterol)
  - Usually urea/creatinine initially normal
  - In children >10 yrs age at onset of illness investigate for

C3	Hepatitis B, C
ANA	HIV
Anti ds DNA	Kidney Biopsy

- **Indications of kidney Biopsy in Nephrotic Syndrome:** 01:07:05
  - Children < 1 year or > 10years age at onset of illness
  - Family H/O nephritic Syndromes Present
  - Presence of extra renal findings: rash/ arthritis/ anemia
  - Acute or chronic Renal insufficiency
  - Hypertension
  - Gross hematuria

Treatment of Nephrotic syndrome in children 01:08:44

- DOC for initial episode of Nephrotic syndrome in a child – Prednisolone
- **Dose:** 2mg/kg/day or 60 mg/m^2/ day daily for 6 weeks f/b 1.5 mg/kg/day or 40mg/m^2/day every alternate day for 6 weeks (80%-90% children respond within 2-3 weeks)
- **Response to Rx:** Remission within initial 4wk of steroid therapy
- **Remission: Up: ucr <0.2 or** Urine protein <1+ by dipstick for 3 consecutive days

- **Relapse:** Increased morning urine up: ucr ≥2 (or) urine Protein ≥3+, for 3 consecutive days, in a child with NS. who had previously gone into remission
- **Frequently Relapsing NS: (FRNS) :** 2 or more relapses within 6 months of initial treatment (or) 4 or more relapse within 12 months
- **In frequent Relapsing Nephrotic Syndrome: (IFRNS):** Frequency of Relapses is less than that of FRNS
- **Steroid dependent nephrotic syndrome (SDNS):** Relapse during steroid tapering or within 2 weeks of stopping steroids
- **Steroid resistant Nephrotic Syndrome: (SRNS):** Inability to induce remission within 4 weeks of daily steroid therapy

Treatment based on type of nephritic syndrome:

1. **IFRNS:**
   - Treat each relapse
   - Prednisolone 2mg/kg/day till remission F/b 1.5mg/kg every alternate day for 4 weeks
2. **FRN (or) SDNS:**

Steroid threshold
<0.5 mg/kg alternate day
↓
Continue low dose alternate dose alternate day prednisolone for 9-18 months

Steroid threshold
>0.5 mg/kg alternate day (or) features of steroid Toxicity
↓
- Levamisole (Preferred in India)
- Oral cyclophosphamide (in west)
- Mycophenolate Mofetil (MMF)

3. **SRNS**
   - Usually caused by FSGS in 80% cases
   - DOC:Calcineurin inhibitors (Cyclosporine/Tacrolimus)
4. **Refractory cases:** Rituximab (Anti CD20 Ab)
5. **Supportive care**
   - Severe edema
     - Sodium &/or fluid restriction
     - Albumin infusion f/b Furosemide cautiously
   - Dyslipidemia
     - Limit dietary fat intake
   - Infection:
     - Treat with Antibiotics
     - SBP:MC cause is streptococcus Pneumoniae
     - Rx: 3rd gen cephalosporins iv
6. **Vaccination**
   - Respiratory Pneumococcus
   - Annual influenza vaccination

Table 63.1

Primary/idiopathic	Secondary	Hereditary
• Minimal change disease (MCD)	• SLE	• Mutation in genes encoding critical component of Glomerular filtration apparatus
• Focal segmental Glomerulo sclerosis FSGS	• HSP	
• Membrano- proliferative Glomerulonephritis (MPGN)	• Malignancy (leukemia/ Lymphoma)	
• Membranous nephropathy	• Infections (Hep B, HIV, Malaria)	
	• Drugs-NSAIDS, Penicillamine, Rifampicin	

CLINICAL QUESTIONS

Q. A 10 years boy presented with Cola coloured urine, oliguria for 3 days, facial puffiness, edema and hypertension. Urine albumin is positive and C3 levels are reduceD. BP is 130/80. He had skin infection two weeks back. Which of the following is true about this condition?

A. Renal biopsy is required in all cases
B. C3 levels return to normal in 6-8 weeks
C. Cyclosporine is the treatment of choice
D. Most common age group involved is 1-4 years

Answer: B

Solution

The given clinical picture suggests a diagnosis of nephritic syndrome, most probably post-streptococcal glomerulonephritis (PSGN).

Poststreptococcal glomerulonephritis (PSGN) is a classic example of the acute nephritic syndrome characterized by the sudden onset of gross hematuria, edema, hypertension, and renal insufficiency.

PSGN follows infection of the throat or skin by certain "nephritogenic" strains of group A β-hemolytic streptococci. (Throat serotypes - M1, M4, M25, and some strains of M12 and skin serotype - M49)

Poststreptococcal GN usually affects school-age children (5-12 years of age) and is uncommon below 3 years of age.

Lab Diagnosis of PSGN:

- Antistreptolysin O titer is commonly elevated after a pharyngeal infection but rarely increases after streptococcal skin infections.
- Best single antibody to document cutaneous streptococcal infection is anti deoxyribonuclease (DNase) B level
- The serum C3 level is significantly reduced in >90% of patients, and returns to normal 6-8 wk after onset. (Some authors say that it takes 8-12 weeks for C3 levels to come back to normal)
- C4 is most often normal.
- Serum CH50 is commonly depressed
- On electron microscopy, electron-dense deposits, or "humps," are observed on the epithelial side of the glomerular basement membrane.
- A biopsy is rarely indicated when:
  - renal function is severely impaired beyond 7-10 days
  - serum C3 remains depressed beyond 12 weeks
  - Patient with features of a systemic illness

Management of PSGN involves:

- Symptomatic & supportive therapy (treating the acute effects of renal insufficiency and hypertension)

Q. A 10 year old boy presents with acute onset gross hematuria, loin pain, and diarrheA. Peripheral smear examination is normal. There is no history of decreased urine output. Serum C3 levels are normal. Probable diagnosis is?

A. Berger's disease
B. PSGN
C. Microangiopathic hemolytic anemia

D. None of the above

Answer: A

Solution

IgA Nephropathy:

- In Berger's disease (IgA Nephropathy) gross Hematuria occurs within 1-2 days of onset of an upper respiratory or GI infection (**Note: Skin infection leads to poststreptococcal glomerulonephritis (PSGN) and not IgA nephropathy**).
- Mild to moderate hypertension can be seen
- May be associated with loin pain
- Normal serum levels of C3 in IgA nephropathy help to distinguish this disorder from poststreptococcal glomerulonephritis (PSGN) where serum C3 levels are low.
- Serum IgA levels have no diagnostic value in IgA nephropathy because they are elevated in only 15% of pediatric patients.

** Microangiopathic hemolytic anemia results from mechanical damage to red blood cells as they pass through the damaged and thrombotic microvasculature.

** Microangiopathic hemolytic anemia is characterized by morphologically abnormal RBCs, with schistocytes, spherocytes, helmet cells, and an elevated reticulocyte count. So normal peripheral smear examination in the above question rules out microangiopathic hemolytic anemiA.

Reference: Nelson 20/e p 2496-2497; Ghai 9th ed/p- 471

64 OBSTRUCTIVE AND INFECTIVE DISORDERS OF URINARY TRACT

OBSTRUCTIVE UROPATHY

PELVI URETERIC JUNCTION OBSTRUCTION (PUJD) 00:00:27

- Most common in males
- May be seen as fetal hydronephrosis on Antenatal USG
- Severe if A-P diameter of Pelvis of kidney is
  - >10 mm in 2nd trimester
  - >15 mm in 3rd trimester
- SFU grading system (society for fetal urology): for hydronephrosis
- C/F: Palpable renal mass in a neonate or infant with hematuria or UTI or in older children, abdominal / flank/ back pain
- B/L in 10% cases
- **Treatment:** Pyeloplasty

POSTERIOR URETHRAL VALVES (PUV) 00:04:30

- Important causes of Distal urinary tract obstruction in Boys
- Pathophysiology
  - Obstruction at level of PUV
  - Prostatic Urethra dilates
  - Bladder muscle undergoes Hypertrophy (to relieve obstruction & allow passage of urine)
  - VUR is seen in 50% of patients
  - Mild Hydronephrosis to severe renal dysplasia
  - Oligohydramnios & pulmonary Hypoplasia in severe cases
- C/F
  - Antenatal USG: Bilateral Hydronephrosis with Distended bladder & oligohydramnios
    Neonates / infants: weak urinary stream with distended & palpable urinary bladder
  - Older infants & children: Failure to thrive with uremia/sepsis/urinary tract infection
- Diagnosis
  - USG
  - Contrast VCUG (Voiding cysto – urethrogram) or MCU (**micturating cysto-urethrogram**)
- Treatment
  - Transurethral ablation/fulguration of valve leaflets
  - Vesicostomy in severe cases
  - Sepsis IV antibiotics
  - Uremia – Percutaneous Nephrostomy & Dialysis

NEPHROLITHIASIS 00:13:42

- Underlying metabolic cause in 50-75%
  - Hypercalciuria with hypercalcemia
  - Idiopathic hypercalciuria (MC in children)
  - Hyperuricemia (ATLS, von Gierke ds)
  - Hyperoxaluria
  - Cystinosis
- C/F:
  - Microscopic or gross hematuria
  - Other features depending on position of calculus
    - → Ureter/Renal pelvis: severe flank or Abdomen pain (intermittent episodes called renal colic)
    - → Distal ureter: dysuria, urgency & Frequency
    - → Urethra: Dysuria & voiding difficult
- Diagnosis:
  - Abdominal X-ray – Radio opaque calculi
  - Spiral CT of abdomen & pelvis
  - Urine Ca – Hypercalciuria
    - → Urine Ca > 4mg/kg in 24 hrs
      Or
    - → Urine Ca – urine cr > 0.2 in children, > 0.7 in infants
- Treatment of Idiopathic Hypercalciuria:
  - High fluid intake
  - Avoid high protein diet
  - Dietary Ca2 not restricted
  - Thiazide diuretics – increased Ca reabsorption

PRUNE BELLY SYNDROME 00:21:22

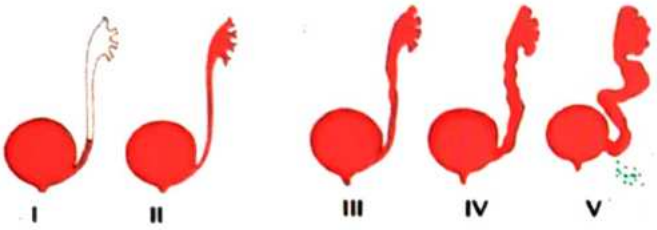
- MC in males
- aka Eagle Barrett Syndrome or Triad Syndrome
- Triad
  - Deficient abdominal wall muscles
  - Undescended testis
  - Urinary tract anomalies due to severe urethral obstruction in fetal life (Very large urinary bladder with massive dilation of ureters & upper tracts & Patent urachus)
- Most patients also have VUR
- Limb anomalies & scoliosis may be associated

VESICO – URETERIC REFLUX (VUR) 00:25:06

- **Definition:** Retrograde flow of urine form urinary bladder to the ureters & pelvis, at rest or during micturition
- Pathophysiology

Pathogenic organism if present in bladder can reach the renal parenchyma
↓
Infection, inflammation & scaring of kidneys
↓
Reflux Nephropathy
↓
Renal insufficiency
↓
ESRD

- Grading of VUR: Based on appearance of urinary Tract on contrast VCUG



Refer Table 64.1

- **C/F**
  - VUR is usually discovered during evaluation of UTI
  - Asymptomatic or isolated fever or Fever + Abdominal pain + dysuria
  - Bladder & Bowel dysfunction seen in 50% of children with VUR
  - 35% of siblings of children with VUR also have it
  - VUR Grade I & II may resolve spontaneously as the child grows
- **Diagnosis**
  - Contrast VCUG
  - Radionuclide Cystogram

  - DMSA Scan useful in renal scarring
- **Treatment**
  - Goal: Prevent VUR related pyelonephritis & renal injury
  - Continuous Antibiotic prophylaxis is recommended for VUR in
    - → Children < 1 yr of age
    - → Those with Bowel/bladder dysfunction
    - → Those with H/O febrile UTI
  - Endoscopic deflux injection at uretero – vesical junction
  - Surgical ureteral reimplantation

URINARY TRACT INFECTION (UTI) 00:39:54

- MC in children <1 yr age
- MC in girls than boys beyond 1st yr of life
- MC cause of UTI in children E-coli > klebsiella & proteus
- **2 types**
  1. Pyelonephritis
  2. Cystitis

Pyelonephritis (Most serious infection in <2yr who have fever without focus)	Cystitis
• Abdominal/black/flank pain	• Only bladder involved
• Fever	• Dysuria, frequency
• Nausea, vomiting	• Urgency
• Neonate – poor feeding, Irritability, Jaundice, Weight loss	• Supra pubic pain, Incontinence

- **Diagnosis**
  - Urine culture
    - → Clean catch midstream urine sample: $>10^5$ CFU/ml significant
    - → In <2yrs of age: catheter or suprapubic aspirate: >50,000 CFU/ml is significant
  - Urine microscopy
    - → PUS cells (>5/HPF) bacteria
  - Dipstick – Leucocyte esterase Nitrite +ve
  - AAP recommends for children 2-24 months of age with 1st episode UTI
    ↓
    USG KUB
    ↓
    VCUG done only if evidence of HDN, scarring or History S/O reflux or obstructive uropathy

- **Treatment:** Antibiotics (iv in <3 months & with complicated UTI)

- **Risk factors for recurrent UTI**
  - Female sex
  - Children <6m
  - Obstructive uropathy
  - Severe VUR
  - Voiding dysfunction
  - Constipation
  - Repeated catheterization

Table 64.1

Reflux of urine into non dilated distal ureter

Reflux into upper collecting system without dilation

VUR into dilated ureter blunting of calyces

VUR into grossly dilated ureter

Massive VUR with significant ureter dilation & tortousity & loss of papillary impression on calyces

CLINICAL QUESTIONS

Q. A 7-month-old boy presents to the hospital with clear-cut symptoms of Urinary tract infection. The patient had no previous history of similar symptoms. Which of the following investigation is not needed during this evaluation of urinary tract infection?

A. DMSA scan
B. Ultrasound of kidney and urinary tract
C. DTPA scan
D. Micturating cystourethogram (MCU)

Answer: C

Solution

Evaluation following the first episode of urinary tract infection:

- **Age < 1 yr :** USG, MCU, DMSA scan
- **Age 1-5 yr :** USG, DMSA scan (if USG or DMSA scan is abnormal : MCU)
- **Age > 5 yr :** USG (if USG abnormal : MCU & DMSA scan)

Reference: O.P Ghai 8th Ed, p 485

Q. A 3 years old boy is detected to have bilateral renal calculi. Metabolic evaluation confirms the presence of marked hypercalciuria with normal levels of calcium, magnesium, phosphate, uric acid and creatinine. A diagnosis of idiopathic hypercalciuria is made. The dietary management includes all of the following EXCEPT:

A. Increased water intake
B. Low sodium diet
C. Reduced calcium intake
D. Avoid meat protein

Answer: C

Solution

Dietary management of idiopathic hypercalciuria:

- Increased water intake
- Low sodium diet (Sodium restriction is important because urinary calcium excretion parallels sodium excretion)
- Avoid meat protein
- **Dietary calcium is not restricted**

Importantly, dietary calcium restriction is not recommended because calcium is a critical requirement for growth, and no evidence supports a relationship between decreased calcium intake and decreased urinary calcium levels. This is particularly important given the association of hypercalciuria with reduced bone mineral density.

65 RENAL TUBULAR DISORDERS

- **Definition:** Non anion gap metabolic acidosis, due to renal tubular dysfunction with usually a normal GFR
- **Types**

1. Proximal (Type II) RTA
2. Distal (Type I) RTA
3. Combined proximal & distal (Type III) RTA
4. Hyperkalemic (Type IV)

PROXIMAL RTA

00:02:30

- Due to defective HCO_3 Resorption from proximal tubule
- Can be isolated HCO_3 wasting or more commonly as a part of Fanconi syndrome

A. Fanconi syndrome

- Global Proximal tubular dysfunction → Low molecular weight proteinuria, Aminoaciduria, Glycosuria, Phosphaturia
- Causes of Fanconi syndrome:
  - **G** – Galactosemia
  - **L** – Lowe syndrome
  - **O** – Cystin**O**sis
  - **B** – Wilson disease
  - **A** – Amyloidosis
  - **L** – Lead

How to remember

- GLOBAL

B. Cystinosis 00:07:02

- Mutation in CTNS gene (for cystinogen)
  ↓
  Defective metabolism of cysteine
  ↓
  Accumulation of cysteine & form of cystine (dimers of cysteine)
- Effects on organs

Refer Table 65.1

- **Other effects**
  - Hypothyroidism
  - Delayed sexual maturation
- **Diagnosis**
  - Cystine crystals in cornea
  - Increased leukocytes cystine content
- **Treatment**
  - Cysteamine (Converts cystine to cysteine)

C. Lowe syndrome: 00:10:08

- aka Occulocerebrorenal syndrome
- congenital cataract, MR, Fanconi syndrome
- X – linked OCRL 1 gene
- **C/F of Proximal RTA**
  - Polyuria
  - Dehydration
  - Hypotonia
  - Failure to thrive
  - General muscle weakness
  - Vomiting
  - Constipation
  - Rickets especially in Fanconi syndrome (d/t phosphaturia)

DISTAL RTA (TYPE IV)

00:12:07

- More common than proximal RTA
- Impaired secretion of H+ ions in distal tubules
  - Urine pH cannot be decreased to <5.5 despite severe M. acidosis
  - Compensatory ↑ K^+ Secretion
    ↓
    Hypokalemia
  - Ca^{2+} & Phosphate released from bone to buffer Extracellular H^+
    ↓
    ↓resorption of Ca^{2+} & phosphate
    ↓
    Hypocalciuria
    ↓
    Nephrocalcinosis & Nephrolithiasis
- C/F
  - Same as proximal RTA plus Nephrolithiasis & nephrocalcinosis
- Distal RTA is MC 1 in children
- Can occur 2 to drugs(amphotericin B, ifosfamide), Wilson ds, sickle cell anemia

00:18:04

	Proximal RTA	Distal RTA
1. Urine PH	<5.5	>5.5
2. Global Proximal tubular dysfunction	Can be seen	Not seen
3. Fractional excretion of HCO_3 ($FeHCO_3$)	>10-15%	2-5%
4. (U-B) Co_2	Normal (>20 mmHg)	Low
5. Urine anion Gap	Negative	Positive
6. Nephrocalcinosis Nephrolithiasis	-	++

- **TYPE IV RTA** 00:23:21
  - Due to impaired aldosterone production (Hypo – aldosteronism) or impaired renal responsiveness to aldosterone (Pseudo hypoaldosteronism)

Impaired K+ excretion in distal tubule	H+ ATPase are not able to function
↓	↓
Hyperkalemia	Metabolic acidosis

BARTER SYNDROME 00:25:15

- A group of disease characterized by Hypokalemic, Hypochloremic, Metabolic alkalosis with hypercalciuria & salt wasting

Type	Gene	Inheritance
I	NKCC2	AR
II	ROMK1	AR
III	CLC kb	AR
IV	CLC ka CLC kb	AR
V	MAGED2	X – linked recessive

- **Clinical features**

Antenatal (Type I, II, IV)	Classical Type III – Milder
• aka Hyper PGE syndrome	• Recurrent Polyuria & Dehydration
• More severe disease	• Failure to thrive
• Maternal polyhydramnios	
• Prematurity	• Non specific fatigue & dizziness
• Severe salt wasting Dehydration & Sometimes Hypotension	• Muscle cramps (Hypokalemia)
• Hearing loss (Type IV)	• BP usually normal

- **Investigation:**
  - Severe Hypokalemia (K+ < 2.5)
  - Metabolic alkalosis
  - Urea/creatinine levels usually normal, urine Ca^{2+} & Cl^- are ed.
  - PGE levels elevated in antenatal form
  - **USG – Nephrocalcinosis in types I & II**
- **Treatment:**
  - Prevent dehydration & maintain nutrition
  - K^+ supplementation
  - Indomethacin – Inhibits PGE (May be effective in antenatal form)

GITELMAN SYNDROME 00:34:53

- Hypokalemic Hypochloremic metabolic alkalosis with Hypocalciuria & Hypomagnesmia
- Defect in gene encoding NCCT (Nacl contrasporter) in DCT
- Presents at late age with recurrent muscle cramps

DENT DISEASE 00:36:36

- X – linked proximal tubulopathy
- Loss of functional mutation CLCN5 Gene that encode renal Cl^-/H^+ antiporter.
- LMW proteinuria, Hypercalciuria & features of Fanconi syndrome
- Nephrolithiasis, Nephrocalcinosis, Renal failure

Table 65.1

Kidney	Eyes	Liver	Brain
• Severe tubular dysfunction • Growth failure	• Retinopathy • Photophobia • Visual acuity	• Hepato-Splenomegaly	• Swallowing dysfunction • Muscle weakness

CLINICAL QUESTIONS

Q. An infant with failure to thrive, hypertension, metabolic acidosis and hyperkalemia presents to a clinician. Most probable cause is?

A. Liddle's syndrome
B. Bartter's syndrome
C. Gitelman's syndrome
D. Gordon syndrome

Answer: D

Solution

Out of the given causes, hyperkalemia is seen only in Gordon syndrome or familial hyperkalemic hypertension or pseudohypoaldosteronism type 2

- Liddle syndrome: hypertension, hypokalemia & metabolic alkalosis
- Gitelman's syndrome: hypokalemia & metabolic alkalosis, hypocalciuria, hypomagnesemia
- Bartter's syndrome: hypokalemia, hypochloremic metabolic alkalosis, hypercalciuria with nephrocalcinosis.

Reference: Nelson 20/e p 2535

Q. A pediatrics patent presents to the hospital with a mutation in Na+/K+/2Cl- transporter in the kidney. Which of the following features is/are correct about this disease?

1. Hypokalaemia
2. Metabolic Alkalosis
3. Hypocalciuria
4. Salt wasting

A. Only 4 is correct
B. Only 1,2,4 is correct
C. Only 1,2,3 is correct
D. Only 2,3,4 is correct

Answer: B

Solution

Bartter syndrome is a group of disorders characterized by hypokalemia, metabolic alkalosis with hypercalciuria, and salt-wasting (resulting from excessive chloride, potassium, and sodium wasting in the thick ascending limb of the loop of Henle)

Bartter syndrome:

- 5 types (I to V)→ All are autosomal recessive except type V which is AD
- Types I, II, and IV - Antenatal Bartter syndrome
- Type III- Classic Bartter syndrome
- Defects or mutations in Bartter syndrome
  - **Na+/K+/2Cl- transporter** (NKCC2)
  - Luminal potassium channel (ROMK)

- Combined chloride channel (CLC-Ka, CLC-Kb)
- Subunit of chloride channels (barttin)
- Basolateral chloride channel (CIC-Kb) causes classic Bartter syndrome.

- **Diagnosis: Failure to thrive, recurrent episodes of dehydration, hypochloremic metabolic alkalosis, hypokalemia, hyponatremia, hypercalciuria, and increased urinary chloride loss are seen.**
- **Elevated urinary levels of chloride (>20-30 mEq/L) are characteristic of Bartter syndrome.**
- Treatment: Indomethacin, potassium supplementation

Reference: Nelson's 20/e p 2533-2535, 2534, Ghai 9/e p 496

LEARNING OBJECTIVES

UNIT 18- PEDIATRIC NEUROLOGY

- Congenital malformations & hydrocephalus
  - NTDs
  - Hydrocephalus
- Seizures in children
  - Febrile seizures
  - Status epilepticus
  - Epilepsy
  - Some epileptic syndromes
- Disorders with CNS involvement & brain death
  - Cerebral palsy
  - CNS infections
  - ICT
  - Brain death

66 CONGENITAL CNS MALFORMATIONS & HYDROCEPHALUS

NEURAL TUBE DEFECTS

00:00:32

- d/t failure of proper closure of neural tube
- They have multifactorial inheritance
- Examples
  - Meningocele
  - Meningomyelocele
  - Anencephaly
  - Spina bifida occulta
  - Iniencephaly
  - Encephalocele
- Diagnosis
  - Antenatal USG
  - Maternal serum or Amniotic Fluid α feto protein level
  - Acetylcholinesterase levels

Important Information

- **Mc congenital neurologic abnormality in children**

- Prevention of NTD'S
- Folic Acid Supplementation

a. Dose
   - 400 µg/ day or 0.4 mg/ day in all women of child bearing age
   - 4000 µg/ day (4 m / day) in high risk women

b. When should it be started?
   - Should be started at least 1 month before conception

c. Folic acid supplementation decreases the risk of NTDs by approx.70%

- Risk of recurrence

a. With 1 affected child with NTD: 3-4%

b. With 2 previous affected children: 10%

HYDROCEPHALUS

00:07:30

- **Definition:** Enlargement of ventricles inside the brain, either d/t ↑ production or impaired drainage of CSF

Types

00:08:52

I. Communicating Hydrocephalus

- Causes
  - **C** - Choroid plexus papilloma
  - **A** - Achondroplasia
  - **M** - Meningeal malignancy or metastasis
  - **P** - Post hemorrhagic

How to remember

CAMP

II. Non – Communicating / Obstructive Hydrocephalus

- Causes
  - **M** - Mass lesion (ICSOL)
  - **A** - Abscess
  - **A** - Aqueductal stenosis
  - **A** -Arnold Chiari malformation
  - **D** - Dandywalker malformation
  - **H** - Hematoma
  - **I** - Infections (Toxoplasma, mumps, Neuro cysticercosis)
  - **V**- Vein of Galen malformation

How to remember

MAAADHIV

  - → Neonate
  - → Heart failure with bounding pulse
  - → Large, bulging anterior fontanella
  - → Cranial bruit on auscultation over ant. fontanella
- Treatment of Hydrocephalus
  - Medical RX
    - → Acute: 3% NaCl or mannitol
    - → Chronic: Acetazolamide or Glycerol
  - Surgical RX
    - → VP shunt (ventriculoperitoneal shunt)
    - → Endoscopic 3rd ventriculostomy (for aqueductal stenosis)

CLINICAL QUESTIONS

Q. This defect most commonly involves which region of the spine?

A. Cervico-dorsal
B. Dorso-lumbar
C. Lumbo-sacral
D. Atlanto-occipital
Answer: C

Solution

- The given image is showing a sac of meninges with some neural component inside it. So it is a meningomyelocele.
- Most common location of a meningomyelocele is lumbo-sacral region.

Other points about meningomyelocele:

- The extent and degree of the neurologic deficit depend on the location of the myelomeningocele and the associated lesions.
- A lesion in the low sacral region causes bowel and bladder incontinence associated with anesthesia in the perineal area but with no impairment of motor function.
- A myelomeningocele above the midlumbar region tends to produce lower motor neuron signs because of abnormalities and disruption of the conus medullaris and above spinal cord structures.
- Treatment: Surgery is often done within a day or so after birth. Meningomyelocele is **covered** with **sterile saline-soaked gauze** till the patient is waiting for surgery to **prevent it from drying, trauma and infection.**

Reference: Nelson's 21/e pg- 11980; nelson 20th/ed pg- 2806

Q. In a lady with history of birth of a previous child with neural tube defect, amount of folic acid to be given in microgram as secondary prophylaxis before next conception is:

A. 40 microgm
B. 400 microgm
C. 4000 microgm
D. 500 microgm
Answer: C

Solution

- To prevent NTDs, it is recommended that **all women** of child-bearing age, who are capable of becoming pregnant should take **0.4 mg (400 µg) of folic acid daily.**

- If a pregnancy is planned in **high risk** women (with previously affected child), supplementation should be started with **4 mg (4000 µg)** of folic acid daily, **beginning 1 month before** the time of the planned conception and continued until at least the 12th wk of gestation, when neurulation is complete.

Reference: Nelson 20th/ed pg 2805-2806; Ghai 9/e pg 557

Q. A case of meningomyelocele was posted for surgery. Till the patient is waiting for surgery, the covering of the sac will be protected by a gauze soaked in:

A. Normal saline
B. Tincture iodine
C. Methylene blue
D. Mercurochrome
Answer: A

Solution

- Meningomyelocele - Herniation of meninges & neural tissue through spinal defect
- Meningomyelocele is **covered** with **sterile saline-soaked gauze** till the patient is waiting for surgery to **prevent it from drying, trauma and infection.**

Other points about meningomyelocele

- Most common location of a meningomyelocele is lumbo-sacral region
- The extent and degree of the neurologic deficit depend on the location of the myelomeningocele and the associated lesions.
- A lesion in the low sacral region causes bowel and bladder incontinence associated with anesthesia in the perineal area but with no impairment of motor function.
- A myelomeningocele above the midlumbar region tends to produce lower motor neuron signs because of abnormalities and disruption of the conus medullaris and above spinal cord structures.
- Treatment: Surgery is often done within a day or so after birth.

Reference: Nelson 20th/e pg-2806; Ghai 9th/e pg-557

67 SEIZURES IN CHILDREN

A. SEIZURES

FEBRILE SEIZURES 00:00:15

- MC cause of seizures in children < 5 Years of age
- Definition: Seizure + significant fever (> 100. 4°F) without any evidence of CNS infection in the age group of 6 months – 5 years
- Types

Simple febrile seizures	Complex febrile seizures (3Fs)
• Generalized seizures • Lasts <15 minutes • No recurrence within 24 hrs	• **F** - **F**ocal seizures • **F** - **F**ifteen minutes or longer • **F** - **F**requent (recurrence may be seen)

- Management
  - In cases where seizure last >5 minutes
  - a. Home Mx:
    - → Rectal diazepam or
    - → Buccal/ nasal midazolam
    - → Put the child in recovery position (left lateral position)
  - b. Hospital Mx
    - → IV lorazepam or midazolam
- No long-term anti epileptics are recommended in the Mx of simple type febrile seizure
- Control of fever is done

Factors increasing risk of recurrence 00:08:14

- Age <1 yr
- Temperature 39-39C (100.4-102.2 F)
- Duration of fever < 24 hrs
- Family history of Febrile seizures
- Complex febrile seizures
- Lower serum Na levels at the time of presentation

Risk factors for epilepsy in a child with febrile seizures 00:10:28

Refer Table 67.1

Previous Year's Questions

Q. Vitamin deficiency causing neonatal seizures? (AIIMS JUNE 2020)

A. Pantothenic acid
B. Pyridoxine
C. Thiamine
D. Riboflavin

STATUS EPILEPTICUS IN CHILDREN 00:14:30

- Definition: Any seizure lasting for >5' min or multiple episodes of seizures without gaining consciousness in between or a child brought with ongoing seizures to a medical facility
- Management
  - It is a Medical emergency
    - → **A** – **A**irway
    - → **B** – **B**reathing
    - → **C** – **C**irculation
  - Get an IV Access
  - Rule out hypoglycemia & hypocalcemia
  - IV lorazepam or midazolam

↓ Seizure persisting

Inj. Phenytoin (20 mg / kg) loading dose

↓ seizure persisting

Repeat inj. phenytoin (10 mg/kg)

↓ seizure persisting

Inj valproate or
Inj levetiracetam or
Inj phenobarbitone

B. EPILEPSY 00:20:01

- At least 1 unprovoked seizure with either seizure recurrence or sufficient clinical or EEG abnormality

Epilepsy syndromes with good prognosis

- Benign neonatal seizures → neonatal period, Fifth Day Fits
- Benign infantile seizures → during 1st year
- Benign childhood epilepsy with centrotemporal spikes or Rolandic epilepsy: 3-13 yrs
- Childhood absence epilepsy: 5-8 yrs
- Juvenile myoclonic epilepsy: 12-18 yrs

Childhood absence epilepsy

- No aura or post ictal phase
- Lip smacking / eye fluttering
- Precipitated by hyperventilation
- EEG: 3Hz spike & wave pattern
- DOC: Ethosuximide& valproate

Previous Year's Questions

Q. Drug of choice for absence seizures? (INICET NOV 2020)

A. Ethosuximide
B. Valproate
C. Carbamazepine
D. Phenytoin

Juvenile Myoclonic Epilepsy

- Adolescent
- Myoclonic jerks
- Drops objects (drop attacks)
- prominent during early morning
- Doc: Valproate

Previous Year's Questions

Q. About Juvenile myoclonic epilepsy, all are true except? (AIIMS Nov 2019)

A. Valproate is contraindicated
B. Lamotrigine can be given
C. Phenytoin is not the preferred drug
D. Polygenic inheritance

Important Information

- **Doc for focal seizures in children → oxcarbazepine> carbamazepine**

Epilepsy syndrome with poor prognosis

- Ohtahara syndrome: Infancy
- Rasmussen syndrome: 6-12 yrs
- Dravet syndrome: Infancy
- Lennox Gastaut syndrome (LGS): 3-10 yrs
  - Developmental delay / intellectual disability
  - Multiple types of seizures
  - Difficult to control despite multiple antiepileptics
  - EEG: 1-2 Hz slow wave & spike pattern
- Evolution of syndromes
  - Ohtahara syndrome → WEST syndrome → LGS

Previous Year's Questions

Q. Which of the following epileptic syndromes will not present during infancy? (JIPMER Dec 2019)

A. Ohtohara syndrome
B. West syndrome
C. Lennox- Gastaut syndrome
D. Dravet syndrome

WEST SYNDROME

- Triad of
  - Infantile spasms (Salaam Attacks/flexor spasms)
  - Developmental delay
  - Hypsarrhythmia (on EEG)

  → DOC: Inj ACTH (adreno corticotropic hormone)

  → DOC: For west syndrome in a child with tuberous sclerosis: Vigabatrin

Previous Year's Questions

Q. A 1 yr old child was brought with sudden onset multiple spasms. On examination he had shagreen patch and 4 hypomelontic macules on extremities. What is the drug of choice for this seizure type? (JIPMER Dec 2019)

A. Carbamazepine
B. Phenytoin
C. Vigabatrin
D. Steroids

BREAK THROUGH SEIZURES

- A child who is a known case of seizure disorder on antiepileptics, present again with an episode of seizure

Management

- 1st drug: Inj. Lorazepam/ midazolam
- If the child is not on maximum dose of any antiepileptic, then give half the loading dose of same antiepileptic

Dose Range

- Valproate - 20-50 mg /kg/day
- Phenytoin - 5-8 mg/ kg/day
- Phenobarbitone - 3-5 mg/kg/day (Doc for neonatal seizures)

Table 67.1

Risk factors	Risk for epilepsy (%)
Simple febrile seizures	1%
Recurrent febrile seizures	4%
Complex febrile seizures	6%
Fever of < 1 hr before febrile seizure	11%
Family H/O epilepsy	18%
Complex febrile seizure (focal)	29%
Neurodevelopment abnormalities	33%

CLINICAL QUESTIONS

Q. A 7-year-old boy presents with a right-sided hemangioma and left-sided focal seizures. The most likely diagnosis is:

A. Neurofibromatosis
B. Incontinentia pigmenti
C. Hypermelanosis of Ito
D. Sturge-Weber disease
Answer: D

Solution
Sturge-Weber Syndrome (SWS):

- **Angiomas involving leptomeninges** & skin of face, typically in ophthalmic & maxillary divisions distributions of trigeminal nerve.
- The **hallmark** of SWS is a **facial cutaneous venous dilation**, also referred to as a nevus flammeus or **port-wine stain**.
- **Contralateral focal seizures**, **calcification** of cerebral cortex and **glaucoma** on same side as skin lesions are seen.

Port-wine stain

Tram track calcification

Hypomelanosis of Ito:

- It is a rare congenital skin disorder affecting children of both sexes
- Characterised by Hypopigmented macules arranged in sharply demarcated whorls, streaks, and patches that follow the lines of Blaschko
- It can have associated defects in several organ systems.
  - Nervous system- Intellectual disability, seizures, microcephaly and hypotonia
  - Musculoskeletal system- Scoliosis and thoracic and limb deformities.
  - Ophthalmologic defects- Strabismus, nystagmus

Neurofibromatosis:

Diagnostic criteria for NF-1 requires presence of 2 or more of the following:

- **6 or more café-au-lait spots**, each >5 mm, before puberty or >15 mm in older persons
- **2 or more neurofibromas** or one plexiform neuroma
- **Freckling** in axillary or inguinal regions
- **Optic glioma**
- 2 or more **lisch nodules, dysplasia of the sphenoid bone** or thinning of the cortex of long bones with or without pseudarthrosis
- A **first degree relative with NF1**

Incontinentia pigmenti:

- It is a multisystem ectodermal disorder with dermatologic (Hyperpigmented macular whorls on trunk), dental (late dentition, hypodontia, conical teeth) and ocular abnormalities (neovascularization, microphthalmos, strabismus, optic nerve atrophy, cataracts).

Reference: Ghai 9/e p 558

Q. A child was found to have eye lesions as shown in the picture below. Diagnostic criteria for the disease that this child may be suffering from include all the following EXCEPT?

A. Axillary freckling
B. Cafe au lait spots
C. A first degree relative suffering from the same disease
D. Anemia
Answer: D

Solution

The given picture shows presence of lisch nodules involving the iris, which is a feature of Neurofibromatosis type 1 (NF1)

Diagnostic criteria for NF1 requires presence of 2 or more of the following:

- **6 or more café-au-lait spots**, each >5 mm, before puberty or >15 mm in older persons
- **2 or more neurofibromas** or one plexiform neuroma
- **Freckling** in axillary or inguinal regions
- **Optic glioma**
- 2 or more **lisch nodules, dysplasia of the sphenoid bone** or thinning of the cortex of long bones with or without pseudarthrosis
- A **first degree relative with NF1**

Reference: Ghai 9th ed pg 558

68 DISORDERS WITH CNS INVOLVEMENT AND BRAIN DEATH

A. CEREBRAL PALSY

00:00:28

Definition: A group of disorders of movement & posture, causing activity limitation, d/t non -progressive disturbances that occurred in the developing fetal or infant brain

Types of CP	Area of brain involved
1. Spastic diplegia	• Periventricular Area (PVL: Periventricular, Leukomalaci or PVHI-(Periventricular hemorrhagic infarct)
2. Spastic quadriplegia	• Multicystic encephalopathy • Parasagittal brain injury
3. Spastic hemiplegia	• MCA territory infarct
4. Dyskinetic or Extra pyramidal CP	• Basal ganglia (neonatal jaundice/kernicterus)
5. Hypotonic CP	• Cerebellar lesion

B. CNS INFECTIONS IN CHILDREN

00:06:22

ACUTE BACTERIAL MENINGITIS

00:06:52

Etiology

	In India	In world
Neonates	• E. coli	• Grp B streptococci > E. coli. > Listeria
Infants and Older children	• Strept pneumonia • N. Meningitidis • N. influenza	

Risk factors

- Young infants due to lack of pre-existing immunity to pathogens causing meningitis
- Recent colonization with pathogenic bacteria
- Close contact with individual having invasive infection with pathogenic organisms

Important Information

- Risk of pneumococcal meningitis is increased in those with congenital or acquired CSF leak e.g.. lumbar dural sinus. cribriform plate defects . middle / inner ear fistulas. skull fractures

Clinical Features of Meningitis

00:12:25

A. Non-specific features: fever, anorexia, poor feeding, tachycardia, hypotension, petechia, purpura
- Older children: headache, myalgia & arthralgia

B. Signs of meningeal irritation:
- Nuchal rigidity
- Meningeal signs

i. Kernig's sign
ii. Brudzinski' sign
} not consistently present in children < 12-18 month age

C. Features of raised ICT

i. Cytotoxic edema
ii. Vasogenic edema
iii. Interstitial edema
} all 3 seen

- Headache, vomiting
- Bulging fontanelle
- Widening of sutures
- Oculomotor or abducens nerve palsy
- Hypertension + bradycardia
- Decorticate or decerebrate posturing

D. Fundus examination: papilledema – more common in complicated meningitis or an underlying chronic process eg., brain abscess or subdural empyema.

E. Focal neurological signs may be seen
- Seizures: due to cerebritis, infarction, electrolyte disturbances
- Altered sensorium

Diagnosis

00:20:09

- Lumbar puncture: CSF study

- Neutrophilic pleocytosis (cell count > 1000/mm3 with 75-95% neutrophils)
- Increased proteins (100-150 mg/dl)
- Decreased CSF glucose(<50% of serum glucose)
- Gram stain & culture sensitivity

- Contraindications to LP
  - Evidence of increased ICT
  - Severe cardiopulmonary compromise eg., shock requiring prompt resuscitation

Treatment 00:23:13

- Prompt initiation of empirical antibiotics
  - IV 3rd gen. cephalosprin (ceftriaxone) + vancomycin
  - CSF becomes sterile 24-48 hrs after starting appropriate antibiotics
  - Duration: 10-14 days
- Corticosteroids: inj. Dexamethasone helps in decreasing cytokine mediated CNS injury
  - It decreases risk of hearing loss in meningitis due to H. influenzae
  - Should be started 1-2 hr before antibiotics & used for 48 hrs

Complications

- Subdural empyema
- SIADH
- DIC

Prognosis

- Highest mortality with meningitis is seen with etiology is pneumococcus
- MC neurologic sequaele following acute bacterial meningitis in children: sensorimotor hearing loss (due to cochlear or auditory nerve inflammation)

Previous Year's Questions

Q. Indication for lumbar puncture in child with febrile seizures are all except? (JIPMER Nov 2018)
A. All infants < 6 months
B. Children 6-12 months with no Hib & pneumococcal vaccination
C. Severely ill infants with clinical signs & symptoms
D. Infants pretreated with antibiotics

TUBERCULAR MENINGITIS 00:28:46

- One of the most severe forms of TB
- Pathogenesis

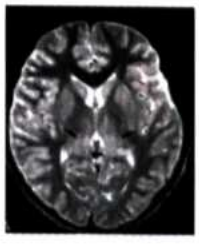
Primary infection
↓
Bacillemia
↓
Seeding of meninges (RICH's FOCI)
↓
Rupture
↓
Tubercular meningitis

- **Clinical Features**
  - Prodromal stage (fever, anorexia, vomiting, irritability)
  - Focal deficits, seizures, meningeal signs
  - Coma, neurological sequelae
- **Investigations**

1. CNS Imaging (CECT Head)
   - Enhancement of basal meanings/ basal exudates
   - Hydrocephalus
   - tuberculoma with perilesional edema
2. CSF Study
   - Opening pressure elevated
   - Cell count: 500/mm^3 (lymphocytic predominance)
   - Elevated proteins& Low glucose
   - Cob-web coagulum
- Treatment
  - ATT + Steroids

JAPANESE ENCEPHALITIS 00:34:12

- MC cause of encephalitis in children in India (world → enterovirus)
- MC age group affected: 5-15 yrs
- Vector: Culex tri taeniorhynchus



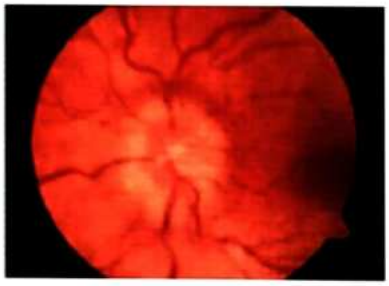
- **Clinical Features**
  - Prodromal stage (fever, headache, vomiting,

Diarrhoea)
  - Encephalitic stage → seizures, focal deficits, features of ↑ ICT
  - Extra pyramidal sequelae, death
- **Diagnosis**
  - CSF study: elevated proteins & normal glucose
  - JE specific IgM ELISA in serum & CSF
  - CNS Imaging: B/L thalamic lesions
- **Treatment**
  - Supportive Rx

C. INTRACRANIAL TENSION

00:38:14

- Normal ICP (mm Hg)
  - Neonates: <5
  - Infants: 6-15
  - Older children: 10-15
- Cerebral Perfusion Pressure (CPP) = MAP – ICP
  - MAP: Mean Arterial Pressure
  - ICP: Intra Cranial Pressure
- Normal CPP (mm Hg)
  - 2-6 yrs: 50
  - 7-10 yrs: 55
  - 11-16 yrs: 65



Important Information

- In neonates and infants with open AF, papilledema is not seen.

Management

1. Fluid of choice: Normal Saline (Isotonic Fluid)
2. Supportive
   - Elevation of head end
   - Midline positioning
   - Sedation and analgesia
   - Controlled mechanical ventilation
3. Osmolar agents: Mannitol or hypertonic saline (3% NaCl)
4. Refractory cases Mx
   - Decompressive craniectomy
   - Phenobarbitol infusion
   - Hypothermia
   - Lumbar CSF drainage
5. Long term Mx: Oral Acetazolamide or glycerol

D. BRAIN DEATH

00:46:52

- **Definition**: Irreversible cessation of all functions of entire brain including brain stem
- Brain Death in Children Is Usually due to Trauma or asphyxial brain injury
- 3 Key Components of Dx of Brain Death

1. Irreversible coma with a known cause
2. Absence of brain stem reflexes (light reflex, corneal reflex, gag reflex)
3. Apnea: Absence of respiratory efforts in response to an adequate stimulus (PCO_2 > 60 mm Hg)
   - All these Findings must remain consistent for 2 examinations separated by an observation period of
     → 24 hrs in neonates
     → 12 hrs in infants & older children

- Findings seen occasionally compatible with dx of brain death
  - Respiration like movements
  - Sweating & flushing
  - BP may remain normal without pharmacological support
  - DTRs elicitable
  - Superficial Abdominal reflexes elicitable
- Features incompatible with the dx of brain death
  - Decerebrate/ Decorticate posturing
  - Presence of Seizures
  - Extensor or flexor response to painful stimulus

LEARNING OBJECTIVES

UNIT 19: MUSCULOSKELETAL DISORDERS IN CHILDREN

- Disorders of muscles
  - Muscular dystrophies
  - Congenital myopathies
  - AFOP
  - NMJ disorders
  - SMA
- Rickets
  - Rickets in detail
  - VDDR
  - Familial hypophosphatemic rickets
- Imp. Disorders involving bones
  - Scurvy
  - Osteopetrosis
  - Osteogenesis imperfecta
  - JIA
  - Reactive Arthrirtis

69 DISORDERS INVOLVING MUSCLES IN CHILDREN

MUSCULAR DYSTROPHY 00:00:28

Definition: A group of inherited disorders of muscles with progressive muscle damage.

1. **Duchenne muscular dystrophy (DMD) and Becker muscular dystrophy (BMD)** 00:02:00

a. Inheritance (in both): Both have x-linked recessive mode of inheritance.

b. Gene affected (in both): Dystrophin gene (one of the largest genes known in humans) on Xp21

	DMD	BMD
Onset	< 5 year age	> 6 years age
Progression of disease	Rapid	Slower
Mutations responsible	Frame- Shift mutation	In-Frame mutation
Non ambulatory by	9 – 10.5 years	> 15 years
Cardio – respiratory problems	Later onset	Earlier onset of myalgia, respiratory distress and rhabdomyolysis

c. **Clinical features (of both)** 00:07:34

- Family H/o similar complaints in maternal uncle or siblings may be there
- H/o delayed walking
- Waddling gait
- Early weakness of neck flexors
- Pseudo hypertrophy of calf muscles
- Valley sign
- Gower's sign
- ↑sed lumbar lordosis
- Contractures
- Varying degrees of intellectual disability
- After loss of ambulation
  - Kyphoscoliosis
  - Upper limb weakness
  - Bulbar dysfunction
  - Weakness of intercoastal and diaphragmatic muscles which may lead to respiratory insufficiency
  - Cardiomyopathy and arrhythmias

} Cardiorespiratory problems are the M/C cause of mortality in a child with DMD

Important Information

- 10% of female carriers may show weakness and ↑sed CPK levels
- Rarely due to complete inactivation (unfavourable lyonisation) of normal X chromosomes

↓

Full DMD phenotype in females

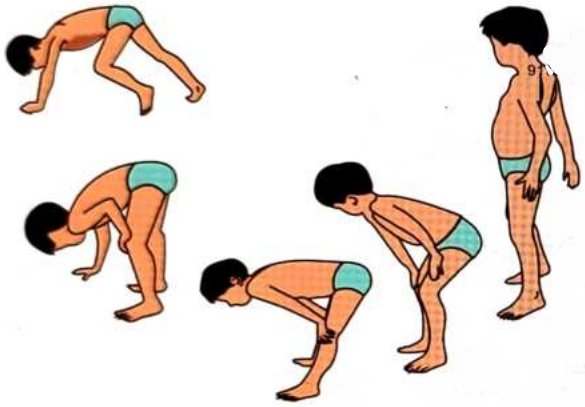
d. **Signs in the examination of DMD and BMD**

- Pseudo hypertrophy of calf muscles
  - Seen in both DMD/BMD
- Sometimes called as inverted bottle appearance.

Valley sign

- A depression b/w hypertrophied deltoid and infraspinatus muscles.

Gower's sign



- Usually seen beyond 3 years age
- Not specific

e. **Investigations (of both)** 00:17:40

i. Serum CPK levels (creatinine phosphokinase levels)
- Normal: < 160 IL/L
- In DMD >: 10,000 IL/L

ii. Mutations in dystrophin gene
- Multiplex PCR or MLPA (Multiplex ligation dependent probe amplification)

iii. Muscles biopsy in mutation -ve cases

↓

-Light microscopy

↓

Necrosis and/ or regeneration of muscles fibres.

↓

Later replaced by fibro fatty tissues

-Immunohisto-chemistry → absent dystrophin staining in DMD and patchy/ reduced staining in DMD

f. **Treatment (of both)** 00:21:12
- Physiotherapy
- Corticosteroids (E.g. Prednisolone) → To improve muscle strength and prolong ambulation.
- Supportive care → To check for respiratory/ cardiac problems/ immunization.
- Newer drug → Eteplirsen → (Exon 51 skipping antisense oligonucleotide)

Important Information

Eteplirsen

↓

Binds to RNA and skips over defective exon.

↓

Restores the reading frame

↓

Shorter but potentially functional dystrophin in produced.

2. Myotonic dystrophy 00:24:48

a. Due to abnormal ↑se in no. of CTG repeats (to > 80) in DMPK gene on chromosome 19

b. Antenatal period: ↓sed fetal movements and polyhydramnios.

c. Facial abnormalities
- Myotonic facies → Inverted V shaped upper lips and bitemporal hallowing

d. Myotonia (Hallmark of myotonic dystrophy)

↓

Delayed relaxation of muscles after contraction (Contraction can be voluntary/ stretch reflex induced/ electric stimulation).

e. Progressive wasting of distal muscles of hands
- Flat thenar and hypothenar eminences and deep grooves b/w fingers
- Tongue: Thin and atrophic
- Proximal muscles eventually atrophy
- Gower's Sign +ve

3. Facio-scapulo humeral dystrophy (FSHD) 00:31:30
- Asymmetric facial weakness +nt
- Winging of scapula is an early finding
- Atrophy of biceps and triceps with sparing of deltoid and forearm muscles "Popeye arm appearance"
- Hearing loss and retinal involvement may be seen.

4. Limb girdle muscular dystrophy (LGMD) 00:33:40
- Mainly affects muscles of hip and shoulder girdles
- Predominantly lower limb weakness in children
- As weakness progress → DTRs diminished
- Cardiac involvement may occur
- Intellectual functions: Usually normal

5. **Congenital muscular dystrophy** 00:35:30
- Presents in neonatal period or infancy
- Hypotonia, weakness, arthrogryposis, bulbar dysfunction or respiratory insufficiency may be seen.

CONGENITAL MYOPATHIES 00:36:35

Definition: Non progressive inherited disorders involving muscles where subcellular abnormalities are seen on muscle biopsy.

Types
1. Central core disease
2. Centro nuclear myopathies
3. Congenital fibre type disproportion myopathy
4. Nemaline myopathy

Clinical features
- Present as 'Floppy infant'
- Hypotonia, static/ non progressive muscles weakness, DTRs normally decreases
- Respiratory insufficiency, feeding difficulties, contracture +nt

Investigation
- CPK levels normal or mildly elevated
- EMG: Myopathic patter
- Muscles biopsy

ACUTE FLACCID PARALYSIS (AFP) 00:41:11

- Rapid onset progressive weakness with absence of spasticity or other UMN signs, in children < 15 year age.
- Common causes
  - Gullian Barre syndrome
  - Poliomyelitis
  - Transverse myelitis
  - Traumatic neuritis
  - Post diphtheritic polyneuropathy

DISORDERS OF NEUROMUSCULAR JUNCTION

Myasthenia gravis 00:43:16
- **Basic defect**
  - A chronic autoimmune disease of post synaptic motor and plate leading to abnormal neuro-muscular transmission or blockade
  - Release of Ach in synaptic cleft is normal but motor end plate is less sensitive and has less no. of receptors of Ach to bind.
- **Clinical features**
  - 20% patient presents during childhood / adolescence
  - Fatigable weakness is the hallmark

  - Most patient has ptosis and ophthalmoplegia, but pupillary reactions are normal
  - 'Peep sign' +ve → On an attempt to tightly close the eyes, cornea may get exposed after a few moments due to inability to sustain contraction of orbicularis oculi
  - Bulbar weakness → Difficulty in swallowing and chewing and nasal intonation of speech.
  - Limb weakness → Proximal and symmetrical
  - Respiratory muscle involvement → Myasthenic crisis
- **Investigation**
  - Edrophonium testing → Transient improvement with 10 sec present till 120 seconds
  - Neostigmine test: Response in 10 – 15 min
  - Repetitive nerve stimulation test: ↓se of > 10% is characteristic
  - Acetylcholine receptor antibody testing (anti Ach R) or Antibodies to muscles specific kinase (anit MuSK) may be seen
- **Treatment**
  - Cholinesterase (-)tors e.g.: Pyridostigmine
  - Low dose steroids or Azathioprine/ Cyclosporine/ Cyclophosphamide/ MMF may be used
  - Thymectomy in refractory seropositive patients

DISORDER OF ANTERIOR HORN CELLS

Spinal muscular atrophy (SMA) 00:55:18
- Basic defect
  - AR due to mutation: SMN 1 gene on chromosome 5
- Types and Clinical features
  - Type 0
    - → Most severe type, present in fetal life
    - → Most Children do not survive
  - Type 1: Werdnig Hoffman disease
    - → Infantile onset
    - → Profound hypotonia, flaccid weakness
    - → These children never learn to sit
    - → Global areflexia
    - → Respiratory muscles weakness and poor swallowing → Recurrent aspirations

→ Tongue fasciculation is an important finding

- Type 2
  - → Usually onset: 16 – 18 months
  - → Usually able to sit unaided
  - → Kyphoscoliosis, tremors (polyminimyoclonus) poor swallowing and respiratory insufficiency
- Type 3
  - → Present at > 18 months age
  - → Usually able to walk
  - → Global areflexia, fasciculation and tremors seen

Treatment

- Supportive
- Ensure adequate nutrition
- Address the respiratory/ feeding/ swallowing problems
- "Nusinersin": An antisense oligonucleotide, nearly FDA approved drug for spinal cord atrophy

Important Information

Q. A 16 year old boy with pain in calf for 2 days. 5 days ago history of fever, sore throat and cough, currently no abnormality, only pain on pressing the muscles. CK levels 2000 IU/L diagnosis?

(AIIMS Nov 2016)

A. Duchenne muscular dystrophy
B. Dermatomyositis
C. Viral myositis
D. Guillain bare syndrome

CLINICAL QUESTIONS

Q. A pediatrics patient presents to the hospital with proximal muscle weakness in lower limbs associated with pseudohypertrophy of calf muscles. The patient started with Eteplirsen which has been recently approved by FDA showed some improvement. Which of the following is the most probable diagnosis?

A. Duchenne muscular dystrophy
B. Spinal muscular atrophy
C. SSPE
D. AML

Answer: A

Solution

Duchenne muscular dystrophy:

- MC hereditary neuromuscular disease in children.
- X-linked recessive deletion of dystrophin gene (Xp 21) - one of the largest gene

C/F:

- More common in males. Family history present
- Pseudohypertrophy of calf muscles
- Cardiac involvement
- Recurrent respiratory infection
- Proximal muscle weakness in limbs
- Intellectual disability
- **'GOWER SIGN'** is positive- Gowers' sign indicates weakness of the proximal muscles, esp of the lower limB.

Mx:

- **Phase 3 trials have shown benefits from ETEPLIRSEN - FDA APPROVED**

Reference: Ghai, 9th ed, Chp - 20, Pg- 590

Q. Identify the disease this child is suffering from?

A. Duchenne muscular dystrophy
B. Myotonic dystrophy
C. Facioscapulohumeral dystrophy
D. Spinal muscular atrophy

Answer: B

Solution

Facial weakness, inverted V–shaped upper lip, and loss of muscle mass in temporal fossae are characteristic of myotonic muscular dystrophy.

- Spinal muscular atrophy- tongue fasciculations, generalised weakness, absent DTR
- Facioscapulohumeral dystrophy- winging of scapula, weakness of facial muscles, atrophy of biceps, triceps, deltoid
- Duchenne muscular dystrophy- pseudohypertrophy of calf muscles, resp infections, Gower sign

Reference: Ghai 9th ed pg 190-191

Q. A 8 year old boy with difficulty in walking showed the following finding. What could be the possible diagnosis?

A. Muscular dystrophy
B. Neuropathy
C. GBS
D. Polymyositis

Answer: A

Solution

The given picture shows pseudohypertrophy of calf muscles: seen in **Duchenne muscular dystrophy.**

Duchenne muscular dystrophy:

- MC hereditary neuromuscular disease in children.
- X-linked recessive deletion of dystrophin gene (Xp 21) - one of the largest gene

C/F:

- More common in males. Family history present
- Pseudohypertrophy of calf muscles
- Cardiac involvement

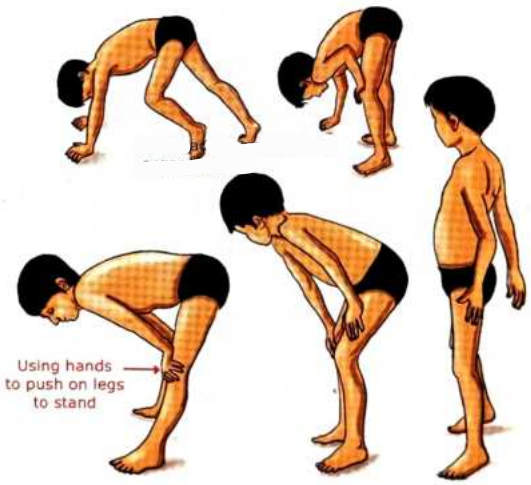
- Recurrent respiratory infection
- Proximal muscle weakness in limbs
- Intellectual disability
- **'GOWER SIGN'** is positive- Gower's sign indicates weakness of the proximal muscles, esp of the lower limbs.
- Serum creatine kinase are **highly elevated** i.e. > 10 times upper limit of normal but do not correlate with severity of the disease.
- Newer therapies include **exon skipping using antisense oligonucleotides.** Ex: **Etiplirsen** has been approved by FDA

Other options

- Polymyositis: It is a subacute inflammatory myopathy affecting adults, without rash, involvement of eye, family history of neuromuscular disease.
- GBS :The first symptoms of Guillain–Barré syndrome are numbness, tingling, and pain, alone or in combination. This is followed by weakness of the legs and arms that affects both sides equally and worsens over time.
- Neuropathy is damage or dysfunction of one or more nerves that typically results in numbness, tingling, muscle weakness and pain in the affected areA.

Reference: Nelson's 20/e p 2976-2977

Q. In which of the following diseases, the clinical feature shown in these pictures can be elicited?



A. Cerebral palsy
B. Friedreich's ataxia
C. Duchenne muscular dystrophy
D. Parkinsonism

Answer: C

Solution

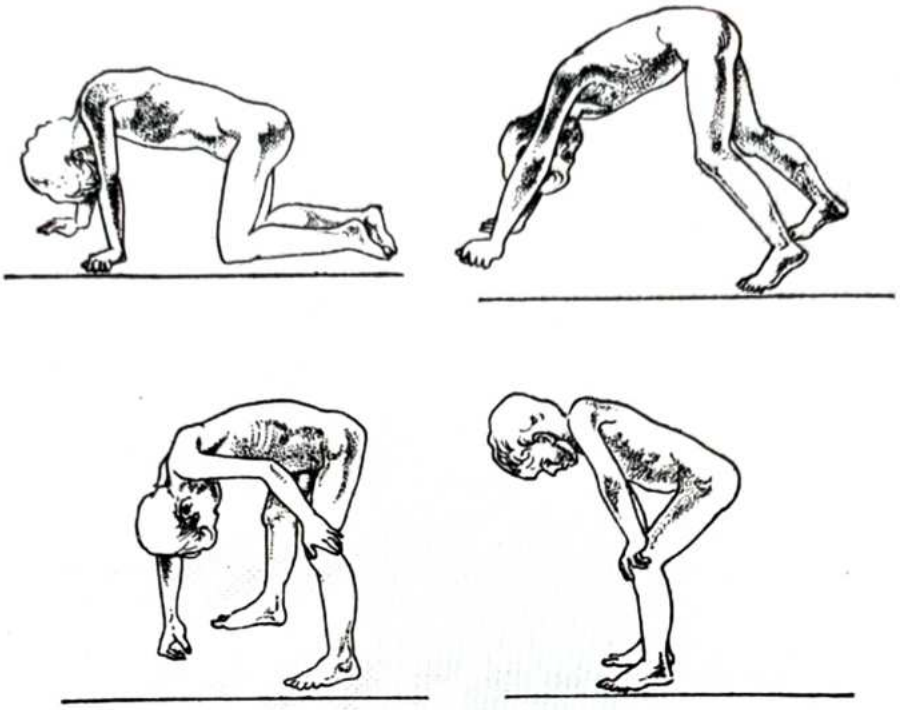
Gower's sign indicates weakness of the proximal muscles, especially of the lower limbs.

Seen in:

- Duchenne muscular dystrophy
- Becker muscular dystrophy
- Centronuclear myopathy
- Myotonic dystrophy

Reference: Nelson's 20/e pg- 2915-2985; Ghai 9/e pg- 590

Q. 7 years old male patient came to the hospital with a complaint of below-depicted image. On examination, the patient presents with hypertrophy of calf muscles. Serum creatine kinase is elevated 10 times the normal limit. Which of the following protein defect is seen in this disease?



A. Dystrophin
B. Alpha-actinin
C. Nebulin
D. Desmin

Answer: A

Solution

C/F:

- More common in males
- Family history present
- Pseudohypertrophy of calf muscles
- Cardiac involvement
- Recurrent respiratory infection
- Proximal muscle weakness in limbs
- Intellectual disability
- **'GOWER SIGN'** is positive- Gower's sign indicates weakness of the proximal muscles, esp of the lower limbs.
- Serum creatine kinase is **highly elevated** i.e. > 10 times the upper limit of normal but does not correlate with the severity of the disease.
- Newer therapies include **exon skipping using antisense oligonucleotides.** Ex: **Etiplirsen** has been approved by FDA

Reference: Nelson's 20/e p 2915-2985, Ghai 9/e p 589

70 RICKETS

RICKETS

Definition: It is a disease of growing bones due to defective mineralisation of the bone matrix at the growth plate in children, before fusion of epiphysis.

Pathophysiology of Rickets 00:02:18

Defective mineralisation of bones matrix at growth plate

↓

Growth plate cartilage and osteoid continue to expand, but mineralisation is inadequate

Bone are soft	Bone width increases at growth plate and distal end of metaphasis
↓	↓
• Bony deformities • Fracture	Wrist widening

Etiology of Rickets 00:06:48

- MC cause of Rickets is nutritional deficiency of Vitamin D

Nutritional Rickets	Refractory Rickets
• Vit D deficiency ○ Congenital deficiency ○ Inadequate dietary intake ○ Malabsorption ○ Liver/ Kidney Disease • Ca deficiency • Phosphate deficiency	• Rickets that does not response to the usual treatment of nutritional Rickets ○ VDDR types I and II ○ Hypophosphatemic Rickets ○ Chronic kidney disease (CKD): ↑ Phosphate level ○ Renal tubular acidosis (proximal / distal) ○ Oncogenous/ Tumor induced → Some benign mesenchymal tumor: Secrete FGF-23 → Phosphaturia & hypophosphatemia

Clinical features of Rickets 00:13:23

I. General

- Failure to thrive
- Protruded abdomen
- Listlessness
- Increased risk of respiratory infections: Softening of ribs, impairs air movement during respiration
- Increased risk of fractures

II. Head and Face

- Craniotabes: Due to softening of cranial bones; also seen in OI, congenital syphilis, hydrocephalus, prematurity
- Frontal and parietal bossing
- Large AF and delayed closed of AF
- Delayed dentition and dental caries

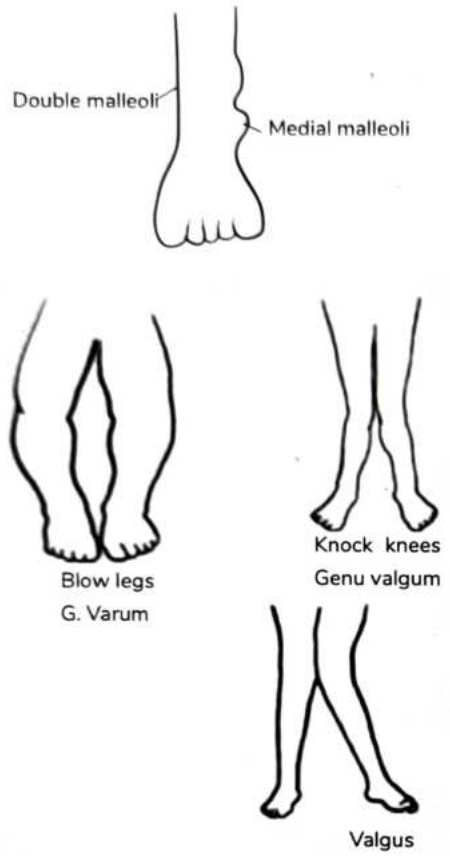
III. Chest

- Rachitic rosary: Beading of costochondral junctions
- Harrison sulcus: Due to pulling of softened ribs by diaphragm

Harrison sulcus

IV. Limbs

- Wrist widening
- Genu varum or valgum deformity
- Windswept deformity
- Bowing of tibia
- Double malleoli



V. Hypocalcemia

- Tetany
- Seizures
- Stridor
- Trousseau sign (more specific)
- Chvostek sign

Investigations 00:24:11

- Serum calcium Normal or low
- Serum: Normal or Low
- Alkaline phosphatase: High
- 25 (OH) Vit D3: Low (< 10 ng/ml or < 30 nmol/L) (Normal: > 20 ng/ml or > 50 nmol/L)

X-ray wrist or knees 00:26:05

- 1st change due to loss of normal zone of provision calcification adjacent to metaphasis → blurring of metaphyseal margin → "Fraying"
- Cartilage hypertrophy → widening of growth plate → splaying
- Soft bones → cupping
- Generalized reduction in bone mineral density: Osteoporosis

Treatment 00:29:55

Vit D	Calcium	
Neonates and infants: 2000 IU/day	+ 500 mg/day	Minimum 3 months f/b maintenance dose of Vit D and Ca
1 – 18 yr: 3000 – 6000 IU/day	+ 600 – 800 mg/day	

VDDR (VITAMIN D DEPENDENT RICKETS) 00:32:47

- AR inherited Rickets
- Usually manifests during infancy

VDDR Type I: Due to deficiency of 1 alpha hydroxylase which converts 25(OH)vit D3 into 1,25(OH)2 Vit D3 which is the active form of vit D

- **Investigations**
  - Decreased blood Ca levels
  - Normal to low phosphate levels
  - Increased alkaline phosphatase levels
  - Normal 25(OH) vit D3 level
  - 1,25 (OH)2 vit D3 level markedly low despite of hypocalcemia.
- **Rx:** Calcitriol + Calcium +/- Phosphate

VDDR Type II: Vit D resistant rickets

- End organ resistance to 1, 25 (OH) 2 Vit D3
- **Clinical** features
  - Early onset Rickets
  - High prevalence of alopecia and ectodermal defects (oligodontia, Milia, Epidermal cysts)
- **Investigations**
  - Hypocalcaemia and hypophosphatemia
  - Secondary hyper PTH
  - Elevated 1, 25 (OH) 2 Vit D3 Level
- **Treatment**
  - Large dose of Ca2+ for prolonged period
  - Responses to Rx not satisfactory

FAMILIAL HYPOPHOSPHATEMIC RICKETS

00:41:11

- X lined dominant inheritance (XLD)
- Gene: PHEX gene (Phosphate regulating gene with Homology to an Endopeptidase on X chromosome)

↓

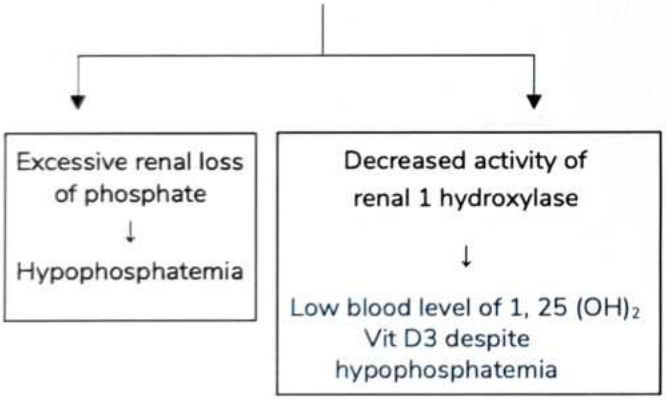
Normally produce an endopeptidase, that is responsible for breakdown of FGF-23

- **Pathophysiology**

Mutation of PHEX gene

↓

Increased in FGF – 23 levels



- **Clinical features**
  - Lower limb deformities are common
  - Skull deformities and dental abnormalities seen
  - Absent symptoms of Hypocalcaemia

- **Investigations**
  - S. calcium: Normal / Mildly decreased
  - Serum Phosphate: Low (1.5 – 3 mg/dl); urine phosphate → increased
  - Alk phosphate : increased
  - PTH – normal
  - 1, 25 $(OH)_2$ Vit D_3 level: inappropriately low for the serum phosphate

- **Treatment**
  - High doses of oral phosphate and Vit D3 (Calcidiol)

Important Information

Q. A 6 yr old female presenting with joint deformities had received multiple course of Vit D with no improvement. Her lab values are given below.

- Calcium: 9.5 mg/dl
- Phosphorous: 1.6 mg/dl
- Alkaline phosphates: 814 IU with normal serum parathyroid hormone, electrolytes creatine

A. Vit D dependent rickets type I
B. Vit D dependent rickets type 2
C. Hypophosphatemic rickets
D. CRF

CLINICAL QUESTIONS

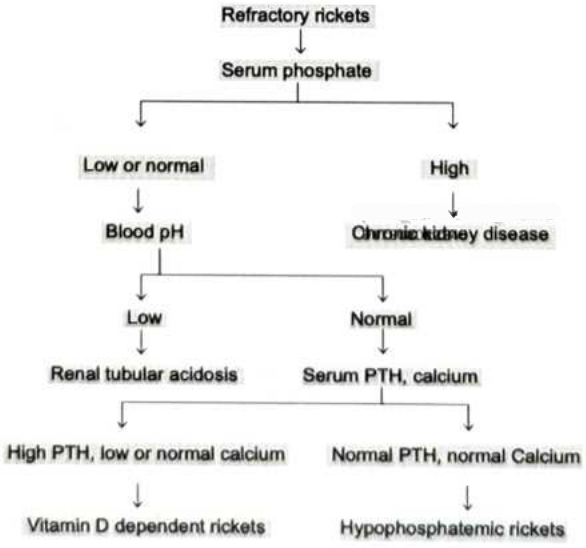
Q. A pediatrics patient came to the hospital with a complaint of poor growth and development associated with improper dentition. The X-ray of the patient is given here. Lab examination reveals low calcium, elevated phosphorus, elevated parathormone, and elevated alkaline phosphatase. Which of the following is the most probable diagnosis?

A. Vitamin D deficiency, type I
B. Vitamin D deficiency, type II
C. Hypophosphatemia rickets
D. Chronic kidney disease
Answer: D

Solution

All of the conditions mentioned in the question are causes of Rickets, so elevated alkaline phosphatase is seen in all the above.

- Chronic kidney disease is the only condition out of the above, where Phosphate is elevated.



Reference: Nelson's 20/e p 336-340, Ghai 9/e p 115

Q. A 2-year-old boy has clinical presentation of rickets. His investigations revealed serum Calcium-9 mg/dL, Phosphate-2.4 mg/dL, alkaline phosphatase – 1041 IU, normal intact parathyroid hormone and bicarbonate 22 mEq/L. Which among the following statement(s) is/are true:

A. X linked recessive disorder
B. CRF may be the cause
C. Defect in mineralisation of matrix
D. Normal zone of calcification around metaphysis
E. Proximal renal tubular dysfunction may lead to low phosphate

Answer: C, E

Solution

Clues in this question are – Normal calcium, Low phosphate, Normal parathormone, & elevated alkaline phosphatase. All these suggest the diagnosis of **hypophosphatemic rickets**.

Hypophosphatemic rickets:

- X-linked dominant inheritance (Hence option 1 is wrong)
- Due to PHEX gene defect
- Increased FGF-23 production → Increased excretion of phosphate → Inhibits 1 alpha hydroxylase activity → Rickets

Discussing other Options:

- **Rickets**: A disease of growing bones due to defective mineralization of the bone matrix (Hence option 3 is correct)
- First change to appear on x-ray is a 'loss of normal zone of provisional calcification' adjacent to metaphysis (Hence option 4 is wrong)
- In CRF - Hyperphosphatemia (not hypophosphatemia) is seen due to reduced excretion of phosphate (Hence option 2 is wrong)
- Proximal renal tubular dysfunction may lead to low phosphate (Hence option 5 is correct)

Extra Edge:

Lab findings in different types of Rickets

	Plasma Ca	Plasma PO4	ALP	25, OHD	1,25 OHD	PTH
Vit. D deficiency	↓	↓	↑	↓	↓	↑
VDDR, type I	↓	↓	↑	↔	↓	↑
VDDR, type II	↓	↓	↑	↔	↑	↑
X-linked hypophosphataemic	↔	↓	↑	↔	↔	↔ or ↑
Renal tubular acidosis	↓ or ↔	↓	↑	↔	↔ or ↑	↔

71 IMPORTANT DISORDERS INVOLVING BONES IN CHILDREN

SCURVY

Basic defect 00:00:21

Deficiency of Vit C
↓
Defective collagen synthesis (vit C is required for collagen synthesis)
↓
Increased vascular fragility

Risk Factors: Child predominantly fed on cow's milk

Clinical Features

- Gum bleeding
- Petechiae
- Sub periosteal hemorrhage involving long bones
  - Painful pseudo paralysis
  - Crying on touch
- Scorbitic rosary

Important Information

scorbitic rosary	Rachitic rosary
• Feature of scurvy ○ Sharp & angulated ○ Tender & painful	• Features of rickets ○ Rounded ○ Not painful

Diagnosis: X Ray features of scurvy

- Pencil thin outline of cortex
- Sub periosteal hemorrhage
- Wimberger sign (ring shaped epiphysis)
- Pelkan spur (bony spur)
- Trümmerfeld zone
- White line of Frenkel
- Ground glass appearance of bones

Treatment of scurvy

- Vit C supplementation
- Diet rich in vit C (citrus fruits)

OSTEOPETROSIS / MARBLE BONE DISEASE 00:07:18

- Defect: mutation in CLCN7gene
- leads to defective resorption of bones
  ↓
  increased density of bones
- Clinical features
  - Neurological problems due to compression of nerves
  - Deafness
  - Bone marrow infiltration: pancytopenia-anemia, bleeding, infections
  - Increased extramedullary hematopoiesis: large head, hepatosplenomegaly
- X ray findings in osteopetrosis
  - Increased density of bones
  - Bone within bone appearance

OSTEOGENESIS IMPERFECTA

00:11:51

- Defect: type 1 collagen defect
- 12 types → type I – V have autosomal dominant inheritance

> **Important Information**
>
> - **M/C mode of inheritance in osteogenesis imperfecta: AD**

- Types I & IV have subtypes
  - A -nt
  - B +nt

  } abnormal translucent teeth (Dentinogenous impercta)
- **Clinical features**
  - Triad: Blue sclera, deafness, bony deformities
  - Hyperextensible joints
  - Dental manifestations
- Family history in parents / siblings +ve
- **Treatment**: Bisphosphonates like pamidronate

PHOCOMELIA

00:17:11

- Limbs resemble flippers of a seal
- Maternal intake of thalidomide during pregnancy is a risk factor
- Short proximal segments of limbs

INFANTILE HYPEROSTOSIS (CAFFEY'S DISEASE)

00:18:58

- M/C in early infancy (around 10 weeks)
- M/C involved bone: mandible f/b clavicle, ulna
- **Clinical features**
  - Sudden onset irritability
  - Painful soft tissue swelling with wood like induration but minimal warmth & redness (suppuration is absent)
  - a/w fever, anemia
  - episode can last from 2 weeks to 3 months
- X – ray: cortical thickening of underlying bones
- **On investigation**: increased ESR & alkaline phosphatase, anemia & thrombocytosis
- **Treatment**: indomethacin& prednisolone

JIA (JUVENILE IDIOPATHIC ARTHRITIS)

00:22:09

- Definition: Arthritis of ≥ 1 joints , lasting for at least 6 weeks , in a child < 16 yrs of age

Types

1. Oligo articular: 4 or less joints involved; mc type a/w Uveitis/ iridocyclitis; more in girls
2. Poly articular: >4 joints involved
3. Systemic onset: Fever, rash, hepatosplenomegaly

> **Important Information**
>
> - **Arthritis in SLE is Non- erosive arthritis**

REACTIVE ARTHRITIS

00:25:07

- joint inflammation caused by sterile inflammation reaction following a recent entropathic or urogenital infection.
- Pathogenic organisms mainly responsible are:

a. Entropathic infection, Salmonella, Shigella flexneri, Yersisnia enterocolitis, Campylobacter jejuni
b. Urogenital infection, Chlamydia trachomatis

- 75% patients with reactive arthritis are HLA -B27 + ve
- **Clinical features**
  - Symptoms often begin 3 days to 6 weeks following infection
  - Asymmetric oligoarthritis with prediclection for lower limbs
  - Enthesitis: in 90 % patients
  - Fever, fatigue, malaise seen
  - HLA-B27 +ve : increased risk of symptomatic uveitis
  - Less common features: sterile pyuria, conjunctivitis, optic neuritis
  - C/F may last from weeks to months

- **Diagnosis**
  - There is no single test for reactive arthritis
  - ESR, CRP, platelet count may be elevated
  - Imaging: normal/non-specific

- **Treatment**
  - Physical therapy
  - NSAIDs
  - Intra articular steroid injection in severe cases

LEARNING OBJECTIVES

UNIT 20: PEDIATRIC ENDOCRINOLOGY

- Disorders of pituitary
  - Multiple pituitary disorders
  - Isolated GH deficiency
  - GH excess
  - DI
  - MEN syndrome
- Disorders of thyroid in children
  - Congenital & acquired hypothyroidism
  - Endemic cretinism hyperthyroidism
- Adrenal disorders
  - Adrenal physiology
  - CAH
  - Adrenal insufficiency
  - Cushing syndrome
  - Aldosterone excess
  - Pheochromocytoma
- Disorders of sexual development
- Disorders of puberty
  - Precocious puberty
  - Delayed puberty
- Type 1 DM and obesity
- POISONONG IN CHILDREN

72 DISORDERS OF PITUITARY

A. MULTIPLE PITUITARY HORMONE DEFICIENCY 00:00:36

Genetic

- HESX1 gene
- PTX2 gene
- LHX3 gene
- LHX4 gene
- PROP1 gene
- POU1F1 gene

Acquired

1. Brain damage
- Trauma
- Neurosurgery
- Radiation

2. Tumors
- Pituitary adenoma
- Craniopharyngioma
- Meningioma
- Glioma

3. Infections
- Brain abscess
- Meningoencephalitis

4. Others
- Hemochromatosis
- Histiocytosis
- Perinatal insult
- Auto immune disorders

Important Information

- Order in which Pituitary Hormones are Usually Affected
- GH > Gonadotropins (LH & FSH) > TSH > ACTH
- While treating, Corticosteroids should be started before supplementing thyroxine in multiple pituitary hormone deficiency

B. ISOLATED GH DEFICIENCY 00:07:25

- Can be genetic or acquired
- Birth weight & length are normal
- US:LS ratio normal
- Delayed

1. Bone age
2. Dentition
3. Puberty
4. Milestones

} More common in multiple hormone deficiency

- Hypoglycemia
- Frontal bossing
- High pitched voice
- Short stature

Situations in which growth hormone (GH) deficiency can be seen 00:10:20

- Physiology of GH secretion

Hypothalamus
↓ ← GHRH receptor
Pulsatile secretion of GHRH (Growth hormone releasing hormone)
↓
GH receptor ← Receptor insensitivity to GHRH
(+) ↓ (-)
Ghrelin → ↓ ← (Somatostatin)
Pulsatile secretion of GH from somatotrophs in pituitary ← GH deficiency due to mutations
↓
GH receptor ← Mutation leading to resistance of receptors to GHRH (Laron syndrome)
↓
Increased synthesis of IGF-1 (somatomedin or insulin like growth factor -1) from liver and growth plate in children
↓
IGF 1 circulates bound to IGF – BP3

	GHRH	GH	IGF-1
GHRH deficiency	Low	Low	Low
Receptor insensitivity to GHRH	N/ increased	Low	Low
GH deficiency due to mutations		Low	Low
Mutation leading to receptor resistance		N/ increased	Low

Q. A child with short stature, normal GH level but low IGF-1 levels. What is the possible cause of it?
Ans. Receptor resistance to GH

Diagnosis

1. GH stimulation test

- Done using insulin(MC used), arginine, clonidine, glucagon, levodopa
- Peak GH level <10 ng/ml → GH deficiency
  - Done for decreased bone age
  - Decreased growth velocity

  } In presence of other C/F as discussed

Treatment

- Recombinant GH injections given subcutaneously
- Should be given for a period of atleast 1-2 years for the results to be apparent
- Effective only if epiphyseal fusion/ closure of long bones has not occurred

Adverse Effects of Gh Therapy

- Pseudotumor cerebri
- Gynecomastia
- Impaired glucose tolerance

C. GH EXCESS

00:29:58

- Results in overgrowth or gigantism during childhood
- After fusion of epiphysis: Acromegaly
- Coarse facies
- large tongue
- Prognathism (protruded lower jaw)
- thick skin
- broad nose
- headache &visual field defects

Best screening test

- IGF 1 LEVEL

Treatment

- Somatostatin analogues (Octreotide)
- GH Receptor antagonist (Pegvisomant)

D. DIABETES INSIPIDUS

00:33:15

- Polyuria &polydipsia
- Polyuria → urine output > 5ml/kg/hr or >2L/m^2/24 hr
- Either d/t vasopressin deficiency (central DI) or insensitivity at the level of kidney (Nephrogenic DI)

Etiology

Central DI	Nephrogenic DI
• Genetic • Acquired • Trauma • Congenital malformations • Tumors (LCH) • Drugs (chemotherapy)	• Genetic • Acquired • Hypercalcemia • Hypokalemia • Drugs • Kidney disease • Sickle cell Disease

Mechanism of Action

Vasopressin (ADH) synthesized in supra optic & para ventricular nuclei of hypothalamus

↓

Posterior pituitary

↓

V2 receptors in renal tubules

↓

Insertion of aquaporin 2 water channels into apical/ Luminal membrane

Diagnosis

- Low urine osmolality (<600 mosm/L) in association with high plasma osmolality [>300 mosm /L)
- Water deprivation test → differentiates psychogenic polydipsia from DI
- Vasopressin response test →to differentiate central DI & nephrogenic DI
- On giving vasopressin exogenously, ↑in urine osmolality by > 50% of base line indicates Central DI

Treatment of DI

- Central DIvasopressin Analogue (desmopressin)
- Nephrogenic DI: Thiazide, Indomethacin & salt Restrictions

MEN (MULTIPLE ENDOCRINE NEOPLASIA) SYNDROMES

00:44:24

MEN 1 (Wermer Syndrome)

- Gene on chromosome 11→ MEN 1 gene → menin
- 3 'P' affected
  - **P** – Pituitary hyperplasia/adenoma
  - **P** – Parathyroid hyperplasia/adenoma
  - **P** – Pancreatic hyperplasia/adenoma/Neuroendocrine tumor

How to remember

- PPP

MEN 2 A (Sipple Syndrome)

- Gene affected: RET gene on chr10
- Features
  - **H** - **H**irschsprung disease
  - **A** - **A**myloidosis
  - **P** - **P**heochromocytoma
  - **P** - **P**ara thyroid hyperplasia / adenoma
  - **Y**- Th**Y**roid carcinoma (medullary)

How to remember

- HAPPY

MEN 2B

- Features
  - **P** – **P**heochromocytoma
  - **M** - **M**edullary thyroid carcinoma
  - **M** - **M**ucosal & GI neuromas
  - **M** - **M**arfanoid features

How to remember

- PPPM

CLINICAL QUESTIONS

Q. A child presents to the hospital with complaints of visual field defects associated with headaches. Physical examination reveals increased longitudinal growth associated with coarse facies, enlarged hands and feet, and macroglossiA. X-ray shows open epiphysis. Which of the following is the cause?

A. Gigantism
B. Acromegaly
C. Beckwith-Wiedemann syndrome
D. Homocystinuria

Answer: A

Solution

- **Excess GH results in:**
  - **GIGANTISM** during childhood with open epiphysis
  - After fusion of epiphysis → **ACROMEGALY**
- **Clinical Features:**
- Coarse facies
- Large tongue
- Prognathism (protruded lower jaw)
- Thick skin
- Broad nose
- Headache & visual field defects
- **Best screening test** → IGF 1 levels
- **TREATMENT:**
  - Somatostatin analogs (**Octreotide**)
  - GH Receptor antagonist (**Pegvisomant**)

Beckwith-Wiedemann syndrome- presents with macrocephaly, macroglossia, omphalocele, hepatosplenomegaly
Homocystinuria - Marfan-like habitus, developmental delay and lens dislocation

Reference: Nelson's 20/e pg-2653

Q. 12 years old male patient came to the hospital with short stature. Series of investigations reveal the presence of GH deficiency. Which of the following change can occur to the Upper segment: lower segment ratio in this condition?

A. Increases
B. Decreases
C. Remains unchanged
D. Cannot comment

Answer: C

Solution

- Growth hormone deficiency is a cause of proportionate short stature
- So upper segment: lower segment ratio remains normal or unchangeD.

CLINICAL FEATURES OF GH DEFICIENCY:

- Delayed bone age
- Delayed dentition
- Delayed puberty
- Delayed milestones
- Hypoglycemia
- Frontal bossing
- High pitched voice
- Short stature

DIAGNOSIS:

1. GH stimulation test
   - Done using insulin/ arginine/ clonidine/ glucagon
   - Peak GH level **<10 ng/ml → GH deficiency**

2. Bone age < Chronological age

Treatment: Recombinant GH injections subcutaneously

Causes of Disproportionate short stature:

Short trunk dwarfism (US: LS ratio- decreases)	**Short limb dwarfism** (US: LS ratio- increases)
Short- Spondyloepiphyseal dysplasia	Rickets
Man- Mucopolysaccharidosis	Achondroplasia
May- Mucolipidosis	Osteogenesis imperfecta
Climb- Caries spine (pott's disease)	Congenital hypothyroidism
High- Hemivertebra	Chondroectodermal dysplasia

Reference: Nelson's 21/e p 11284

Q. A pediatrics patient came to the hospital with complaints of increased urination associated with increased drinking of water. Lab investigations reveal serum hyperosmolality and hypernatremiA. Lesions of which of the hypothalamic nuclei cause these complaints?

A. Dorsomedial nuclei
B. Supraoptic and paraventricular nuclei
C. Median preoptic nuclei
D. Ventromedial nuclei

Answer: B

Solution

- Vasopressin, a 9-amino-acid peptide, has both anti-diuretic and vascular pressor activity
- It is synthesized in the **paraventricular & supraoptic nuclei** of the hypothalamus.
- Deficiency of Vasopressin causes Diabetes insipidus.
- **DI results in Polyuria [urine output > 5ml/kg/hr / >2L/m^2/24 hr] & polydipsia**
- **serum hyperosmolality and hypernatremia seen in Diabetes insipidus**

Satiety center	Ventromedial nuclei (VMN)
Reward center	Medial forebrain bundle
Circadian rhythm	Suprachiasmatic nucleus
Oxytocin	Paraventricular nucleus

Reference: Nelson's 21/e, chapter- 574, pg- 11295, 11296

Q. A 9-year-old boy presents with growth retardation and propensity to hypoglycemiA. Physical examination reveals short stature, micropenis, increased fat and high-pitched voice. The skeletal survey reveals bone age of 5 years. Which of the following is most appropriate diagnosis?

A. Malabsorption
B. Growth hormone deficiency
C. Adrenal tumour
D. Thyroxin deficiency

Answer: B

Solution

- Features mentioned in the question suggests the diagnosis of Growth hormone deficiency

CLINICAL FEATURES OF GH DEFICIENCY:

- Delayed bone age, dentition, puberty [micropenis], milestones
- Hypoglycemia
- Frontal bossing
- High pitched voice
- Short stature [upper segment : lower segment ratio remains normal]
- Bone age < Chronological age
- Hypothyroidism: Lethargy, constipation, cold intolerance, short stature, delayed puberty
- Malabsorption: Features of malnutrition, vitamin deficiencies, proportionate short stature, bone age same as chronological age
- Adrenal tumor: Obesity, striae, hypertension, hirsutism, delayed puberty, short stature

Reference: Ghai 9/e pg 505, 506

Q. A 7-year-old boy underwent neurosurgery for craniopharyngioma following which multiple pituitary functions were lost. Which of the following hormone should be replaced first?

A. Hydrocortisone
B. Thyroxine
C. Growth hormone
D. Prolactin

Answer: A

Solution

- **Hydrocortisone** should be supplemented first in hypopituitarism
- **Hypopituitarism:** Underproduction of growth hormone (GH) alone or in combination with other pituitary hormones

Causes of hypopituitarism

- Genetic causes:
  - HESX1 gene
  - PROP-1 gene
  - LHX3 gene
  - LHX4 gene
  - PITX2 gene
  - POU1F1 gene
- Acquired causes:
  - Idiopathic
  - Brain damage
    - → Irradiation
    - → Neurosurgery
    - → Trauma
  - Tumors
    - → Pituitary adenoma
    - → Craniopharyngioma
    - → Glioma
    - → Pinealoma
  - Other causes
    - → Inflammation (Histiocytosis)
    - → Sarcoidosis
    - → Autoimmune Hypophysitis
- Order in which pituitary hormones are usually affected: GH > Gonadotropins > TSH > ACTH

Reference: Nelson's 21/e pg 11274; Nelson's 20th/ed pg 2637-2642

Q. 13-year-old boy presented with complaints of episodes of headache, abdominal pain, palpitations, excessive sweating and dizziness. His mother also told that his weight is not gaining. On examination he is hypertensive, and tremors are present. What is the likely cause of child's condition?

A. Diabetes mellitus
B. Hysterical fainting spells
C. Pheochromocytoma
D. Hypothyroidism

Answer: C

Solution

Clinical findings of episodes of headache, abdominal pain, palpitations, excessive sweating, no weight gain and hypertension are s/o **Pheochromocytoma**

Pheochromocytoma:

- Catecholamine-producing tumor that arises from chromaffin cells of abdominal sympathetic chain/ Peri-adrenal area/ Thoracic cavity/Cervical region
- These tumors may arise sporadically or be inherited as features of MEN 2 or von Hippel-Lindau (VHL) disease or Neurofibromatosis
- More likely to be B/L in children
- C/F: Episodes of palpitation, headache, and profuse sweating (classic triad) with dominant sign of **Hypertension**.
- Though appetite is good, weight gain may not occur because of hypermetabolic state.
- Diagnosis : Elevated blood or urinary levels of catecholamines and their metabolites like vanillyl mandelic acid (VMA), metanephrines.
- Rx: surgical removal
  - Preoperative α- and ß-adrenergic blockade and fluid loading are requireD.

Other options:

- Hypothyroidism - Weight gain, lethargy, constipation, normal BP, does not cause episodes of headache and sweating
- Diabetes mellitus - H/o polyuria, polydipsia, weight loss, does not cause episodes of headache and sweating
- Hysteria - Normal BP, cannot produce excessive sweating episodes

Reference: Nelson Textbook of Pediatrics 20th edition page- 2627-2629

73 DISORDERS OF THYROID IN CHILDREN

A. CONGENITAL HYPOTHYROIDISM 00:00:32

- MC preventable/ treatable cause of mental retraction/ intellectual disability in children
- Incidence: 1 in 1000 newborns

Etiology

- Thyroid dysgenesis: mc cause of congenital hypothyroidism
- Thyroid dyshormonogenesis: mc cause of congenital hypothyroidism in a
- child with goitre
- Pendred syndrome
  - d/t PDS gene on chr 7 → codes for pendrin (SLC 26A4) which is a chloride-iodide transporter, important in hearing and thyroid pathway.
  - Hearing Loss + Goitre & Hypothyroidism
- Iodine deficiency
- Hypothalamic pituitary dysfunction
- TSH receptor blocking antibody (usually transient)

Clinical Features

- Birth weight & length usually normal
- Wide open Anterior fontanelle and Posterior fontanelle
- Prolonged physiological jaundice (earliest sign sometimes)
- Myxedematous facies: Large, protruded tongue
- Skin: Dry & scaly
- Hypotonia, hypothermia, hoarse cry
- Constipation
- Abdominal distension
- Umbilical hernia
- In Untreated Cases
  - Delayed development
  - Intellectual disability (not seen in neonatal period)
  - Delayed dentition
  - Short stature
  - Delayed puberty
  - Delayed bone maturation (Bone age <Chronological age)

- **Diagnosis**
  - T4 level: Low
  - Primary hypothyroidism: TSH usually > 100 mu/L
  - Central hypothyroidism: Low TSH levels
- **Treatment**
  - Oral Levo thyroxine (early morning with empty stomach)
- **Prevention:** Universal newborn screening for cong. Hypothyroidism
  - At birth, with umbilical cord blood
  - Heel prick: dried blood spots (b/w 2-4 days age)
  - Should not be done in 1st 1-2 days, to avoid TSH surge
  - Most sensitive approach → check for T4 & TSH both

Previous Year's Questions

Q. Most sensitive test for thyroid dysfunction in newborn (JIPMER DEC 2019)

A. Total T3
B. Total T4
C. TSH
D. Free T3

B. ACQUIRED HYPOTHYROIDISM 00:15:34

- MC in girls
- MC cause is auto immune thyroiditis
- Also associated with
  - Down syndrome
  - Turner's syndrome
  - Celiac disease
- **Clinical Features**
  - Firm & nodular goitre
  - Short stature
  - Cold intolerance
  - Lethargy
  - Constipation
  - Delayed dentition
  - Delayed puberty (some may have pseudo precocious puberty)
  - Bradycardia
  - Myopathy/ pseudohypertrophy of muscles
  - Heart failure (in severe cases)

- **Treatment**
  - Thyroxine
  - Dose (decreases with increase in age)
    1. 1-3 yrs age: 4-6 mg/ kg/ day
    2. 10-16 yrs age: 2-4 mg/kg/day

C. ENDEMIC CRETINISM

00:19:38

- Most serious consequence of Iodine deficiency
- 2 Types
  1. Neurologic type
  2. Myxedematous type

1. Neurological Cretinism

- Deaf: Mutism
- Squint
- Spasticity & rigidity → gait problems
- Intellectual disability

2. Myxedematous Cretinism

- Retarded psychomotor development
- Short stature
- Coarse facial features
- Myxedema

Prevention

- Adequate Iodine intake (fortification of food with iodine)
- RDA of Iodine
  1. For children <10 yrs: 40-120 µg/day
  2. For children > 10 yrs: 150 µg/day

D. HYPERTHYROIDISM (RARE)

00:23:34

- Suspected in children with
  - Wt. loss
  - ↑ appetite
  - Tremors
  - Warm extremities
  - ↑ sweating
  - Anxiety
- Eye signs are not commonly seen in children.
- Treatment
  - Propylthiouracil is usually avoided in children(due to risk of hepatotoxicity)
  - Methimazole & Propranolol are used

CLINICAL QUESTIONS

Q. A neonate, whose picture is shown below was found to have high TSH on routine neonatal thyroid screening.

What could be the most common underlying cause?

A. Thyroid dysgenesis
B. Iodine deficiency
C. Pendred syndrome
D. Thyroid dysmhormonogenesis

Answer: D

Solution

- The given picture shows a baby with a neck mass, along with h/o high TSH suggests → goiter (thyroid swelling).
- Most common cause of congenital Hypothyroidism in a baby **with goitre** Is **Thyroid dyshormonogenesis**.
- **Note:** Most common cause of congenital hypothyroidism is Thyroid dysgenesis.

Reference: Nelson Textbook of Pediatrics 21th Edition , Page no: 11399

Q. A 6-month-old infant is brought with a history of constipation and excessive sleepiness. On examination, he is lethargic, has periorbital puffiness, large tongue and umbilical herniA. The investigation which will help to diagnose this condition is:

A. Karyoptyping
B. T4, TSH assay
C. Rectal mucosal biopsy
D. Knee X-ray

Answer: B

Solution

- History given in question shows typical presentation of hypothyroidism, so thyroid hormone assay is required.

DIAGNOSIS OF HYPOTHYROIDISM

- T4 levels → **low**
- **Primary hypothyroidism** → TSH usually > **100** mu/L
- **Central/secondary hypothyroidism** → **low** TSH levels

	TSH	T4
Thyroid dyshormonogenesis	Elevated	Low
Thyroid dysgenesis	Elevated	Low
Central hypothyroidism	Low	Low

Treatment: Oral **Levothyroxine** (early morning with empty stomach)

Reference: Nelson's 21/e pg-11410 , 11411

Q. Intellectual disability once called mental retardation, is characterized by below-average intelligence. Aggression, self-injury, mood disorders, and limitations in adaptive skills are the features of this disability. Which of the following is the most common preventable cause of mental retardation?

A. Down syndrome
B. Congenital hypothyroidism
C. Rett syndrome
D. Fragile X syndrome

Answer: B

Solution

- Congenital hypothyroidism is the M.C preventable cause of mental retardation
- In India, incidence is 1:1000
- Most common cause of congenital hypothyroidism is thyroid dysgenesis.
- Most common cause of congenital hypothyroidism with goiter- Thyroid dyshormonogenesis.

Reference: O.P Ghai 9th/ed page- 511

Q. A 4 week old baby presented with constipation, abdominal distension and prolonged jaundice. His clinical photographs are shown below. Which of the following statements are FALSE about this condition?

A. It is the commonest treatable cause of Intellectual disability
B. Thyroxine is useful in treatment
C. Dysgenesis of thyroid gland is the most common underlying cause
D. Screening for this disorder should be done in 1-2 days after birth

Answer: D

Solution

- History given in the question suggests diagnosis of congenital hypothyroidism

Congenital Hypothyroidism

- Most common preventable/treatable cause of Intellectual disability in children
- Most common cause is thyroid dysgenesis
- Most common cause in a child with goiter: Thyroid dyshormonogenesis
- Clinical features:
  - Wide open Anterior & Posterior fontanelle
  - Prolonged physiological jaundice (earliest sign sometimes)
  - Myxedematous facies
  - Large, protruded tongue
  - Skin → dry & scaly
  - Hypotonia, hypothermia, hoarse cry
  - Constipation
  - Abdominal distension
  - Umbilical hernia
- Newborn screening for congenital hypothyroidism:
- Samples:
  - Umbilical Cord blood (at birth)
  - Heel prick → dried blood spots (between 2-4 days age) - Done at least 48 hrs later to avoid TSH surge
- Most sensitive approach: Measure T4 and TSH both
- Treatment: Oral Levothyroxine (early morning with empty stomach) is useful in treatment

Reference: O.P. Ghai 9th edition pg-511

Q. A 15 years old girl presented with complaints of puffy eyes, swelling in the neck, weight gain, and fatigue. On investigations thyroid peroxidase antibodies present and TSH levels are also elevate D. What of the following is most likely diagnosis?

A. Hashimoto thyroiditis
B. Graves' disease
C. Iodine deficiency
D. Congenital hypothyroidism

Answer: A

Solution

Elevated TSH levels, presence of thyroid peroxidase antibodies and goiter are s/o Hashimoto thyroiditis.

Hashimoto thyroiditis

- Aka Chronic lymphocytic thyroiditis
- Autoimmune disease
- More common in girls
- **C/F**: Goiter, and signs of hypothyroidism like weight gain, fatigue, puffy eyes, slow HR, sensitivity to cold etc.

Investigations shows:

- Anti-thyroglobulin antibodies and TPO-Abs.
- TSH: Elevated

Reference: Nelson/ 21st eD./ Pg. 2923-2924

Q. A mother gave birth to a male baby in her home 2 days ago. The mother complaints that she is anxious, unable to tolerate heat and is fatigued most of the time, and reports that she has not gained much weight despite having an increased appetite. She also told that before pregnancy too she had similar complaints. On examination, she has a tremor, her HR is 100 bpm and has bulging eyes. Based on mother's findings, baby is most likely at risk for development of which of the following?

A. Heart failure
B. Constipation
C. Third-degree heart block
D. Macrocephaly

Answer: A

Solution

The given maternal history of being anxious, heat intolerance, failure to gain weight, tremors, bulging eyes, tachycardia suggest a diagnosis of maternal hyperthyroidism due to grave's disease. So the neonate is probably at risk for neonatal thyrotoxicosis.

Neonatal thyrotoxicosis:

- Occurs due of maternally acquired thyrotropin receptor-stimulating antibody (TRSAb).
- Usually disappears within 2 to 4 months as the concentration of TRSAb falls.
- Unlike TRSAb, TSH does not cross the placentA.
- All forms of thyrotoxicosis are more common in females, except for neonatal thyrotoxicosis, which has an equal sex distribution.
- C/F: Tachycardia, tachypnea, irritability, low birth weight with microcephaly, severe vomiting and diarrhoea, thrombocytopenia, jaundice, hepatosplenomegaly and **heart failure**.
- Eye signs are not commonly seen in children
- Third-degree heart block is sometimes seen in infants born to mothers with SLE.

Reference: Nelson Textbook of Pediatrics 21th E Chapter 584

74 ADRENAL DISORDERS

A. Adrenal physiology
B. Congenital adrenal hyperplasia
C. Adrenal insufficiency
D. Cushing syndrome
E. Aldosterone excess
F. Pheochromocytoma

A. ADRENAL PHYSIOLOGY

00:00:59

- steroid hormones are synthesized in adrenal cortex. Predominantly cortisol is synthesized by fetal adrenal gland.

Pathways of adrenal steroidogenesis

Refer figure 74.1

- Cholesterol is precursor all steroid hormones.
- StAR protein → Steroidogenic acute Regulatory protein that transports cholesterol into mitochondria.
- 3β- HSD →3β- hydroxyl steroid dehydrogenase
- ACTH plays an important role in regulation of glucocorticoids & sex steroid synthesis
- Mineralocorticoid production regulated by:
  - Intravascular volume
  - K^+ level
  - Renin Angiotensin system

Important Information

- **ACTH is not important in the regulation of mineralocorticoid**

B. CONGENITAL ADRENAL HYPERPLASIA (CAH)

00:09:43

- A Group of autosomal recessive defects in steroid hormone synthesis, characterized by deficiency of some hormones & excess of steroid precursors
- CAH is the Mc adrenal disorder seen in children.
- Mc cause of CAH: 21 hydroxylase deficiency
- 2nd mc cause of CAH: 11 β hydroxylase deficiency

21 HYDROXYLASE DEFICIENCY

00:12:47

- **Features**
  - Deficient aldosterone
    → Salt wasting
    → Dehydration
    → Hyperkalemia
  - Deficient glucocorticoids
    → Hypoglycemia
    → Shock
  - Excess sex steroids: Ambiguous genitalia in female neonate
    → In male, genitalia is normal but this increased testosterone is a very important cause of precocious puberty.

Ambiguous genitalia

- **Lab diagnosis**
  - Hyperkalemia
  - ↑ 17 hydroxy progesterone levels (very imp. Screening test for diagnosis of 21 hydroxylase deficiency)
  - Genetic diagnosis: Mutation on chr 6
    → Confirmatory
    → Useful in pre natal diagnosis in next pregnancy
- **Treatment**
  - Hydrocortisone (Life long replacement)
  - Fludrocortisone (Life long replacement)
  - ↑ salt intake
  - ↑ dose of glucocorticoids in times of stressful conditions (surgery, fever)
  - Doc for antenatal Rx of CAH → Dexamethasone
  - In a couple with previous case of CAH neonate, start

dexamethasone as soon as next pregnancy is diagnosed to prevent virilization of female.

11 β HYDROXYLASE DEFICIENCY 00:25:04

- **Features**
  - Excess mineralocorticoids (due to deoxycorticosterone)→ Hypertension, hypokalemia
  - Excess 11 deoxy cortisol → No features of glucocorticoid deficiency
  - Excess sex steroid → Ambiguous genitalia in females

Important Information

- **Ambiguous genitalia in female with HTN : II beta hydroxylase deficiency**

3 β HYDROXY STEROID DEHYDROGENASE DEFICIENCY (3 βSHD) 00:30:28

(This enzyme is common to all the three pathways)

- **Features**
  - Deficient mineralocorticoids: Salt wasting, dehydration, hyperkalemia
  - Deficient glucocorticoids: Hypoglycemia, shock
  - Deficient sex steroids: Normal genitalia in females → Under virilization (ambiguous genitalia) in males

17 HYDROXYLASE DEFICIENCY 00:35:01

- Excess mineralocorticoids: Hypertension, hypokalemia
- No features of glucocorticoid deficiency
- No sex steroids
  - normal genitalia in females
  - under virilization (ambiguous genitalia) in males

	Ambiguous genitalia in Female	Under virilization in Males
With salt wasting & Hyperkalemia	• 21 hydroxylase deficiency	• 3 β hydroxy steroid dehydrogenase deficiency
With Hypertension	• 11 β hydroxylase deficiency	• ydroxylase deficiency

Previous Year's Questions

Q. A 3 week neonate with ambiguous genitalia presented with Na -127meq/L. K- 6meq/L with BP 52/24 mmHg & he was managed with IV fluids. What is the next step in management? (AIIMS MAY 2019)

A. Spironolactone
B. Hydrocortisone administration
C. Antibiotics
D. Calcium gluconate

C. ADRENAL INSUFFICIENCY 00:41:51

- **Primary (Adrenal Defects)**

1. Autoimmune/Addison disease
2. Infections: TB, HIV
3. Adrenal Hemorrhage (Waterhouse Friedrichsen syndrome)
4. CAH d/t 21 hydroxylase / 3 βHSD deficiency
5. StAR defect → lipoid CAH

- **Secondary (↓ ACTH)**

1. Congenital malformations (Holoprosencephaly)
2. Genetic defects
3. Acquired insults (Neuro Sx, Radiotherapy)
4. Tumors
5. Discontinuation of steroids after prolonged Rx

- **Clinical features**
  - Dehydration
  - Lethargy
  - Vomiting
  - Salt craving
  - Hypotension
  - Hyperpigmentation seen in primary Adrenal insufficiency
- **Investigations**
  - Hypoglycemia
  - Hypernatremia
  - Hyperkalemia
  - Hemoconcentration
  - ↑ hematocrit
- **Treatment**: Hydrocortisone, Fludrocortisone

D. CUSHING SYNDROME 00:48:16

- mc cause of adrenocortical hyperfunction in children
- Cushing disease (different from cushing syndrome): Hypercortisolism caused by ACTH producing pituitary tumor

Etiology

Acth dependent	Acth independent	Exogenous administration
1.Hypothalamic Lesions	• Adrenal adenoma / carcinoma	• Glucocorticoids
2. Pituitary lesions- adenoma	• Pigmented nodular hyperplasia	• ACTH
3.Ectopic source • Neuroblastoma • Wilm's tumor • Carcinoid	• Mc cune Albright syndrome	• mc cause of Cushing syndrome in children→ iatrogenic / exogenous administration of steroids

- **Clinical features**
  - Obesity, striae
  - Moon facies, buffalo hump are rare
  - Short stature
  - Hypertension
  - Hirsutism
  - Delayed puberty
  - Bone pains
  - Muscle weakness
  - Behavioural problems
- **Diagnosis**

1. Screening test
   - Assessment of diurnal cortisol rhythm
   - Overnight Dexamethasone suppression test
   - 24hr free Urine cortisol
2. Confirmatory test: Low dose dexamethasone suppression test
   - ACTH **Levels**
     → < 5 pg/ml: ACTH independent cause
     → 15 pg/ml: ACTH dependent cause
     → 100 pg/ml: Ectopic ACTH production
3. Inferior petrosal sinus sampling → best test to identify the source of ACTH production

- **Treatment**

1. Surgical Mx: Resection of pituitary/adrenal lesions.
2. Medical Mx: Metyrapone, Ketoconazole, Mitotane.

E. ALDOSTERONE EXCESS (HYPER ALDOSTERONISM) 01:02:20

- **Primary Aldosteronism/ Conn Syndrome**
  - Adrenal adenoma of Hyperplasia
  - Glucocorticoid remedial Aldosteronism (GRA)
  - d/t genetic defect: aldosterone becomes regulated by ACTH
- **Secondary Hyperaldosteronism** (Activation of renin angiotensin pathway)
  - Renal artery stenosis
  - Renin secreting tumor
  - Congestive cardiac failure
  - Liver disease
  - Nephrotic syndrome
- **Pathophysiology**
  - Excess Na & H_2O absorption → Hypertension
  - Excess K^+ & H^+ loss → Hypokalemic metabolic alkalosis, generalized muscle weakness
- **Diagnosis**

Renin	Aldosteronism	
Low	High	1°
High	High	2°
Low	High	GRA

(Decreases after giving steroids)

- **Treatment**
  - Salt Restriction
  - Aldosterone antagonist (Spironolactone)

F. PHEOCHROMOCYTOMA 01:10:30

- A catecholamine secreting tumor that arises from chromaffin cells of abdominal sympathetic chain / Peri adrenal area/ thoracic cavity
- Rare in children
- More likely to be bilateral than adults
- Co-exist with
  - Neurofibromatosis
  - VHL syndrome
  - MEN syndrome type II
- **Diagnosis**: ↑ urinary VMA (vanillyl mandelic acid) & metanephrines.
- **Treatment**: surgical removal
- Pre-op alpha blockade with prazosin

CLINICAL QUESTIONS

Q. 1-week-old girl was admitted to NICU for evaluation of vomiting and severe dehydration. On examination there is hyperpigmentation of the nipples and virilization. Her laboratory reports shows serum sodium levels very low and serum potassium levels are high but there is no haemolysis and serum glucose is 44 mg/dL. Which of the following is the most likely diagnosis?

A. Pyloric stenosis
B. Secondary hypothyroidism
C. Hyperaldosteronism
D. Congenital adrenal hyperplasia

Answer: D

Solution

Congenital adrenal hyperplasia (adrenogenital syndrome)

- Deficiency of 21-hydroxylase
- Usually manifests during the first 2 weeks of life
- C/F:
  - Due to deficient aldosterone
    - → Salt wasting
    - → Dehydration
    - → Hyperkalemia
  - Due to deficient glucocorticoids
    - → Hypoglycemia
    - → Shock
  - Excess sex steroids
    - → Ambiguous genitalia in female neonate
- Lab findings: Hyponatremia, hyperkalemia, and urinary sodium wasting.

Pyloric stenosis usually begins after the third week of life.

Hypothyroidism presents with lethargy, poor-feeding infant with delayed reflexes, persistent jaundice, and hypotoniA.

Hyperaldosteronism would be expected to cause decreased potassium, not increased levels.

Reference: Nelson Textbook of Pediatrics 21th E Chapter 594

Q. A 6 week infant with ambiguous genitalia (as shown below) presents with an episode of dehydration & shock requiring hospitalization.

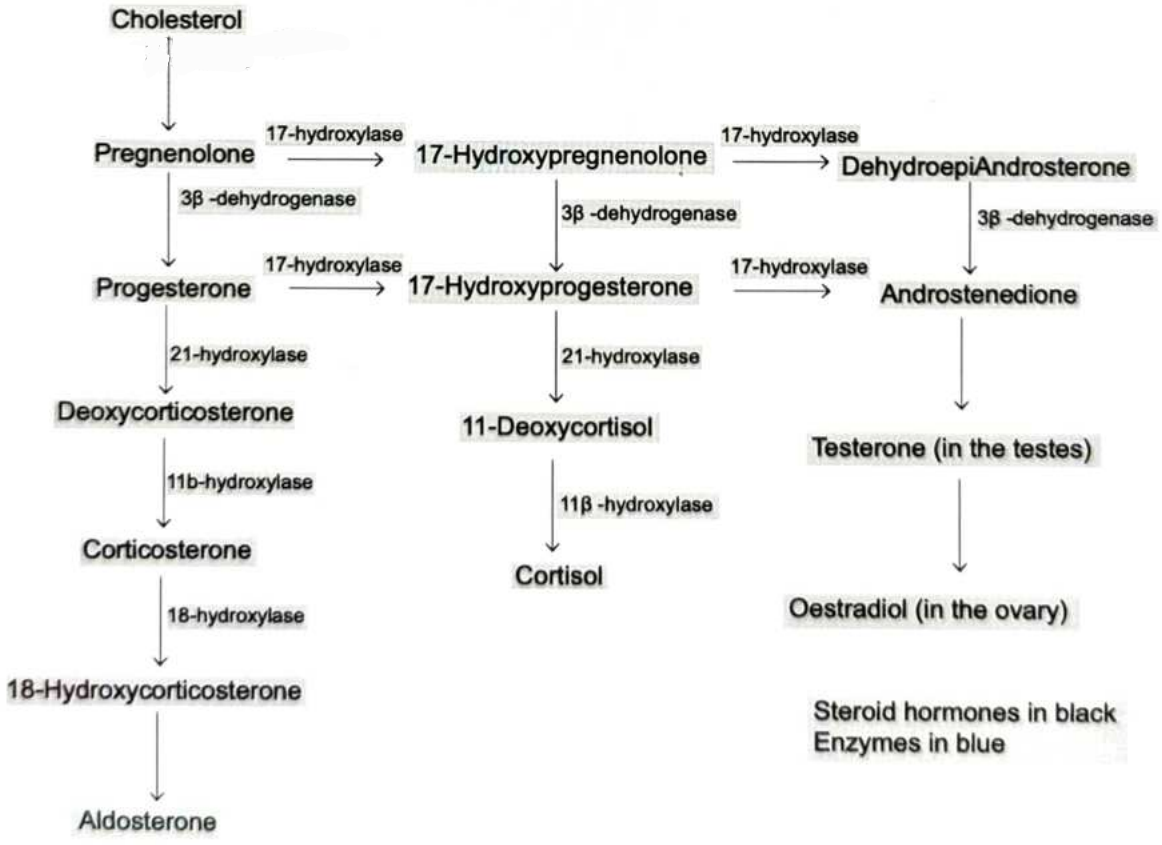
What is the electrolyte abnormality that you expect in this baby?

A. Hypokalemia
B. Hyperkalemia
C. Hypocalcemia
D. Hypercalcemia

Answer: B

Solution

Ambiguous genitalia in an infant with dehydration & shock, suggests the diagnosis of CAH due to 21 hydroxylase deficiency; There is aldosterone and cortisol deficiency leading to hypotension, hypoglycaemia, hyponatremia and hyperkalemiA.



Congenital adrenal hyperplasia:
MC deficiency – 21 hydroxylase: So ↓ aldosterone and costisol production.

↓

↑ androgens

↓

So, enlargement of genital swelling and genital tubercle

↓

Ambiguous genitalia

Metabolic problems:

- Hyponatremia – aldosterone deficiency
- Hyperkalemia
- Hypotension
- Hypoglycaemia

Reference: Nelson 20/e p 2714-2718

75 DISORDERS OF SEXUAL DEVELOPMENT (DSD)

Refer Table 75.1 00:00:45

Refer Table 75.2 00:10:56

ANDROGEN INSENSITIVITY SYNDROME (AIS) 00:24:24

- Previously called 'Testicular Feminisation Syndrome'
- Basic defect – Resistance to androgens
- It is the MC form of 46, XY DSD
- X linked recessive inheritance
- Clinical features
  - Clinical spectrum ranging from phenotypic females (complete AIS) to males with ambiguous genitalia & undervirilization to normal appearing males with infertility (partial AIS)

CAIS

- Genetic males appear females at birth
- External genitalia is female
- Vagina ends blindly in a pouch
- Uterus is absent (due to effect of AMH by testis)
- Testis are usually intra-abdominal, but may be in inguinal canal
- At puberty:
  - Normal development of breast & female habitus (Testosterone acted upon by aromatase to form Estradiol)
  - But menstruation does not occur.
  - Sexual hair is absent
  - Girl with primary amenorrhea, normal breast development but absent axillary / public hairs : Suggestive of CAIS

Partial AIS

- Wide variety of phenotypic presentation ranging from perineoscrotal hypospadias, Bifid scrotum, Cryptorchidism, Clitoromegaly & labial fusion
- At puberty lack of facial hair or voice change

Diagnosis

- Karyotype: 46,XY
- Presence of Testis
- Normal or elevated Testosterone or DHT

Treatment

- Genetic counseling
- In CAIS with female body habitus
  - Testis are removed
  - Replacement therapy with estrogen at puberty

Table 75.1

Germ cells

- (arise from coelomic epithelium of hindgut & midgut & migrate to Gonadal ride by 4-6 weeks of gestation)

↓

Bipotential Gonad

- DAX 1: Suppresses androgen synthesis
- WNT 4: Stimulates expression of DAX 1

- Most important in development of testis : SRY (Sex determining region on Y chromosome)
- SOX9
- WT1 gene

OVARY

↓

- Presence of Estrogen & Absence of AMH (Anti Mullerian Hormone)

↓

- Mullerian development into Fallopian tubes, uterus & upper 2/3 of vagina

TESTIS

↓

Sertoli cells

↓

AMH

↓

Regression of Mullerian ducts

Leyding cells

↓

Testosterone

Wolffian development

5 reductase

↓

DHT (Di hydro Testosterone)

Male external genital development

Table 75.2

DSD		
46, XX DSD	**46, XY DSD**	**Sex chromosome DSD**
1. **Androgen excess** • CAH (21 hydroxylase or 11 hydroxylase deficiency) • Placental aromatase def • Maternal virilising tumors • Mat. Androgenic drug 2. **Abnormal gonadal** ↓ • Ovotesticular DSD	**Disorder of Androgen synthesis or action** 1. CAH • Star def • 3 HSD def • 17 HSD def • 17,20 Lyase def 2. 5 reductase deficiency 3. Androgen insensitivity syndrome 4. Smith Lemli Opitz syndrome	**Abn. Gonadal development** 1. Gonadal dysgenesis 2. Gonadal regression 3. Ovotesticular DSD 1. 45,XO 2. 47,XXY

76 DISORDERS OF PUBERTY

DISORDERS OF PUBERTY

A. Precocious puberty
B. Delayed puberty

Important Information

- Breast development beyond Tanner stage II &testicular volume beyond 4 ml indicate that onset of puberty

PRECOCIOUS PUBERTY

00:02:09

- **Definition**: Onset of puberty before the age of 8 yrs in girls&9 ½ yrs in boys
- Precocious puberty is more common in girls
- 2 Types
  1. Central Precocious Puberty (Gonadotropin Dependent)
  2. Peripheral Precocious Puberty (Gonadotropin Independent)

Important Information

- Central> peripheral in girls

Etiology in girls 00:05:24

1. **Central Precocious Puberty (Gonadotropin Dependent)**

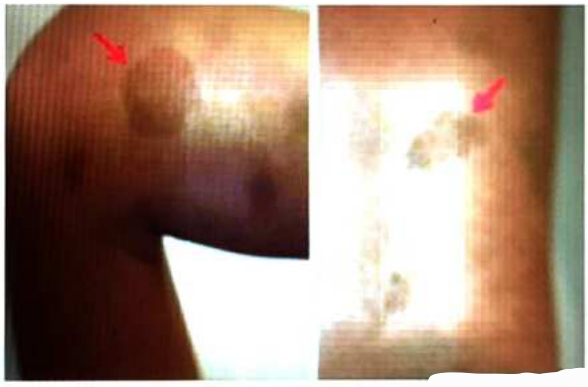
- Idiopathic (more common in girls)
- Infections: TB, meningitis
- Injuries: Trauma, neuro Sx, Radiotherapy
- Tumors: Hypothalamic hamartoma (Gelastic seizures)
- CNS malformations
  - Arachnoid cyst
  - Hydrocephalus
  - Septo-optic dysplasia

2. **Peripheral Precocious Puberty (Gonodotropin Independent)**

- Hypothyroidism
- Ovarian estrogen excess (cyst, tumor, Mc cune Albright syndrome)
- Adrenal estrogen excess
- Exogenous estrogen exposure

MC CUNE Albright Syndrome

- Triad of
  - Precocious puberty
  - Café au lait spots
  - Polyostotic fibrous dysplasia
- Occurs due to somatic activating mutation of stimulatory G- protein



Café au lait spots

- Endocrine Abnormalities
  - Hyperthyroidism
  - Rickets
  - GH excess
  - Precocious puberty

Etiology in boys 00:12:25

1. Central Precocious Puberty

- causes are the ones similar to seen in girls.
- Organic causes are more common in boys

2. Peripheral Precocious Puberty

- Excess androgen production from testis or adrenal is with prepubertal LH levels
- CAH d/t 21 hydroxylase or 11β hydroxylase deficiency (mc cause of peripheral precocious puberty in boys)
- Adrenal tumors → adenoma/ carcinoma
- Testicular tumors → Seminoma/Germinoma
- Testo toxicosis → activation of LH receptors
- HCG secreting tumors → Hepatoblastoma/ germinoma

- Exogenous androgen exposure

Diagnosis
- LH is a better indicator of puberty than FSH
- LH levels > 0.6 mu/L or LH/ FSH ratio >1 indicates development of puberty
- Advanced bone age
- Imaging to rule out CNS/gonadal/ adrenal tumors. MRI is better diagnostic modality.

Treatment
- Rx the underlying cause
- Long acting GnRH analogues (Leuprolide)

DELAYED PUBERTY

00:21:12

- More common in boys
- **Definition**
  - Girls: Lack of secondary sexual characters by 13 yrs age or absence of menarche by the age of 16 yrs or within 5 yrs of onset of puberty
  - Boys: Lack of pubertal changes by 14 yrs of age

Etiology

A. Hypogonadotrophic Hypogonadism (LH & FSH → low) causes same in both boys and girls
- Transient Conditions
  - Chronic systemic illness (CKD, Chronic liver Disease)
  - Severe malnutrition
  - Endocrine causes (hypothyroidism, type 1 DM)
- Permanent Causes
  - Isolated delayed puberty
    - → Genetic mutations →KAL 1 (Kallmann Syndrome), GnRH Receptor, DAX-1 gene
    - → Syndromes→ Prader Willi Syndrome, Laurence Moon Syndrome
  - MPHD (multiple pituitary hormone disease)
    - → Injury
    - → Infiltration by tumors- LCH
    - → Genetic – PROP1,LH
    - → Malformations
    - → Trauma

B. Hypergonadotrophic Hypogonadism (LH & FSH → High)
- **Girls**
  - Gonadal dysgenesis (Turner Syndrome)
  - Steroidogenic defect (StAR deficiency, aromatase deficiency, 17 hydroxylase deficiency)
  - Ovarian insult (surgery / radiotherapy)
  - Autoimmune ovarian failure
  - LH & FSH receptor resistance
- **Boys**
  - Chromosomal abnormalities (Klinefelter Syndrome)
  - Steroidogenic defects (17α hydroxylase deficiency)
  - Testicular insults (trauma, chemotherapy, radiotherapy)
  - Malformations (cryptorchidism)
  - Inefficient testosterone action (5α reductase deficiency)
  - Resistance to testosterone action (androgen insensitivity syndrome)

Investigations
- Screen for systemic diseases
- LH, FSH levels
- Karyotype

Treatment
- HRT to be initiated beyond 12 yrs in girls & 14 yrs in boys, to initiate & maintain sexual character & to prevent osteoporosis

CLINICAL QUESTIONS

Q. years old girl child came to the hospital with signs and symptoms of precocious puberty. Which of the following is the most common cause of central precocious puberty in this case?

A. Exogenous estrogen
B. Idiopathic
C. CNS tumor
D. Hypothyroidism

Answer: B

Solution

- Precocious puberty is defined by the onset of secondary sexual characteristics before the age of 8 years in girls and 9 years in boys.
- MCC of central precocious puberty in girls is IdiopathiC.
- Organic causes are more common in boys.
- Other causes of central precocious puberty in girls:
  - Infections → TB, meningitis
  - Injuries → Trauma, neurosurgery, Radiotherapy
  - Tumors → Hypothalamic hamartoma (Gelastic seizures)→ MCC of organic central precocious puberty
  - CNS malformations like an arachnoid cyst, hydrocephalus, septo-optic dysplasia

Reference: Ghai, 9th edition, pg-529

Q. A child with decreased levels of LH, FSH and Testosterone presents with delayed puberty. Which of the following is the most likely diagnosis:

A. Klinefelter syndrome
B. Kallman syndrome
C. Androgen Insensitivity syndrome
D. Testicular Infection

Answer: B

Solution

- Low LH and FSH points to hypogonadotropic hypogonadism
- Among the given options, only Kallman syndrome is a cause of hypogonadotrophic hypogonadism, where LH, FSH, as well as testosterone levels will be low.
- Kallman syndrome is associated with impaired sensation of smell
- Remaining all options given, present with hypergonadotropic hypogonadism where LH and FSH are raised

DELAYED PUBERTY

1. Hypogonadotropic hypogonadism: both LH and FSH are decreased
   - Reversible causes of hypogonadotropic hypogonadism

- Chronic systemic illness (CKD, Chronic liver Disease)
- Severe malnutrition
- Endocrine causes (hypothyroidism, type 1 DM)

- Permanent causes of hypogonadotropic hypogonadism
  - Isolated delayed puberty
    - → Genetic mutations → KAL 1 (Kallmann Syndrome), GnRH Receptor, DAX-1 gene
    - → Syndromes→ Prader Willi Syndrome, Laurence Moon Syndrome
  - MPHD (multiple pituitary hormone disease)
    - → Injury
    - → Infiltration by tumors- Langerhan cell histiocytosis
    - → Genetic – PROP1, LH
    - → Malformations
    - → Trauma

2. Hyergonadotropic hypogonadism- both LH and FSH are raised
   - Causes in girls
     - Gonadal dysgenesis (Turner syndrome)
     - Ovarian insult
     - Autoimmune ovarian failure
     - LH and FSH receptor resistance
   - Causes in boys
     - Chromosomal abnormalities (Klienfelter syndrome)
     - Testicular insults (trauma, infection)
     - Insufficient testosterone action (5 α-reducatse deficiency)
   - Resistance to testosterone action (androgen insensitivity syndrome)

Reference: Ghai 9/e p 534

Q. A 6-year-old girl presents with precocious puberty, some bony lesions & hyperpigmented skin lesions as shown below.

What is the most probable diagnosis?

A. Prader-Willi syndrome
B. Laurence-Moon-Biedl syndrome
C. Cushing syndrome
D. McCune-Albright syndrome

Answer: D

77 TYPE 1 DIABETES MELLITUS & OBESITY IN CHILDREN

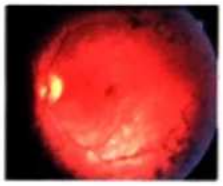
TYPE 1 DM

- MC type in children → type 1 DM
- Diagnostic Criteria

  Symptoms of DM (polyuria/polyphagia/polydipsia)
  +
  FBS ≥ 126 mg/dl (or)
  RBS/PP ≥ 200 mg/dl (or)
  HbA1c ≥ 6.5%
- Dose of glucose for doing OGTT in children → 1.75g/kg of ideal body wt (maximum 75 g)
- RxOC type 1 DM → Insulin
- Dose of insulin
  - Prepubertal children: 0.6 – 0.8 U/kg/day
  - Pubertal age group: 0-1.2 U/kg/ day
- Examples of different insulins 00:03:59
  - Rapid acting: Lispro, Aspart
  - Short acting: Regular
  - Intermediate acting: NPH
  - Long acting: Glargine, Detemir, Degludec
- 2 Regimes (target HbA_{1c}<7.5%)
  - **Basal Bolus Regime**
    - → Long acting → 40-50% of total daily dose (TDD)
    - → Rapid acting → 50-60% of TDD in 2-3 divided closes
  - **Mixed Split Regime**
    - → 2/3rd before breakfast
      - 2/3 intermediate acting (NPH)
      - 1/3 short acting
    - → **1/3rd after dinner**
      - 2/3 intermediate acting (NPH)
      - 1/3 short acting
- Screening for Complications like nephropathy should be started:
  - After 5 yrs of diagnosis in pre pubertal children
  - After 2 yrs of diagnosis in pubertal children

OBESITY 00:08:38

- **Definition**: A condition of excess fat deposition in the body to the extent that health may be impaired.
- **Diagnosis**: BMI (Body Mass Index)
  - BMI = $\frac{wt(kg)}{Ht(m)^2}$
  - For obesity
    - → BMI >/= 95th percentile for age & sex is diagnosed as obesity.
    - → BMI: 85th to 95th percentile according to age & sex is overweight



- Parameters useful in diagnosing obesity 00:12:20

Parameters useful for diagnosis of obesity

Clinical parameters	Investigations

• BMI
• Skin fold thickness
• Waist circumference and waist hip ration
	• Density based methods (based on Archimedes principle)
	  ○ Air displacement plethysomography
	• Scanning methods:
	  ○ E.g.: DEXA, CT scan, MRI scan
	• Bioelectrical impedance methods

Etiology 00:17:01

A. Constitutional (> 90% causes)

- d/t imbalance b/w energy intake & expenditure
- No organic/ underlying cause
- tall for age
- normal development

B. Pathological / organic

i. Endocrine

- Cushing syndrome
- GH deficiency
- Hypothyroidism

ii. Genetic syndromes

- Prader Willi syndrome
- Laurence moon syndrome (obesity, polydactyly and retinal pigment changes)
- Beckwith Wiedemann syndrome

iii. Hypothalamic

- Injury
- Radiotherapy
- Tumors

iv. Drugs

- Steroids
- Antiepileptics
- Estrogen

v. Monogenic disorders

- Leptin deficiency or resistance
- Melanocortin 4 receptor defects

Prader willi syndrome 00:22:52

- Facial dysmorphism in the form of narrow bifrontal diameter of head, almond shaped palpebral fissures, downturned mouth.
- Can be seen as a result of genomic imprinting or uniparental disomy in chromosome 15
- In infancy, severe hypotonia and feeding problems
- Later: Excessive eating and morbid obesity.
- Hypogonadism and short stature seen.
- Cognitive impairment and delayed molar or language milestones

Laurence Moon Bardet Biedel syndrome:

Features:

1. Obesity
2. Retinal pigment changes (H/O vision problems)
3. Post axial polydactyl

L - Learning disability

A
U > Sound as obesity

R - Retinal pigment changes
E - Re - Renal abnormalities
N - No. of digits increased (polydactyl)
C
E - Extra features (Hypogonadism, DM, Hepatic Fibrosis)

How to distinguish constitutional obesity from pathological obesity. 00:30:16

	Characteristics	Constitutional obesity	Pathological obesity
1.	Distribution of fat	Generalised	Central
2.	Height	Normal or tall	Usually short stature
3.	Bone age	Normal or advanced	Usually less
4.	Dysmorphism	(-)nt	(+)nt
5.	Mental ability (Mental function)	Normal	Impaired (Usually)
6.	Family H/O obesity	Common	May not be seen (uncommon)

Complications of obesity 00:34:13

- Insulin resistance (acanthosis nigricans, DM)
- Metabolic syndrome(hyperlipidemia, HTN, diabetes)
- Non-alcoholic fatty liver disease (NAFID)
- Gall stones
- Obstructive sleep apnoea

Prevention and treatment of obesity 00:36:19

- **Prevention**
  - Healthy lifestyle
  - Decrease consumption of junk food
  - Excess food should not be taken
  - Increased physical activity
- **Treatment**

1. Dietary modification: Traffic light diet recommended

Traffic light diet

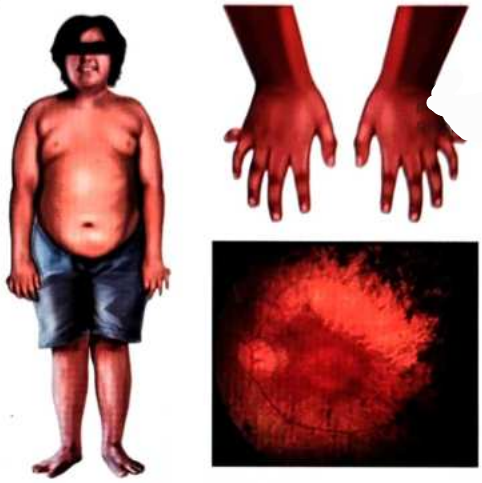
- **Red light:**_____
  - High in calories, sugar and fat
  - e.g. Fatty meats, sugar, fried foods
- **Yellow light:** _____
  - Nutrient dense, but rich in cal. and fat
  - e.g. dairy, starches & grains
- **Green light:** _____
  - Low calorie, high fibre, low fat
  - eg. fruits, vegetables, cereals and legumes

- Red: Avoid
- Yellow: Limited Intake
- Green: UNLIMITED QUANTITY of food can be taken

2. Increase physical activity
3. Orlistat: Gastric lipase inhibitor
4. Metformin: for insulin resistance
5. Bariatric Sx: laparoscopic adjustable banding (only in those with morbid obesity, where other measures have failed)

CLINICAL QUESTIONS

Q. Which disease is the most likely diagnosis as depicted by these pictures of a child, his hands and retina?



A. Carpenter syndrome
B. Alstrom syndrome
C. Laurence-Moon-Bardet-Biedl syndrome
D. Prader-Willi syndrome

Answer: C

Solution

Obesity, Polydactyly, Retinitis pigmentosa: So Clinical features given in the question suggest the diagnosis of Laurence-Moon-Bardet-Biedl syndrome

Laurence-Moon-Bardet-Biedl syndrome

- D/t mutation in BBS1 gene
- **Charaterized by**
  - Obesity
  - Hypogonadotropic hypogonadism → Delayed puberty
  - Post axial polydactyly, syndactyly
  - Retinitis pigmentosa
  - Renal abnormalities

Other options:

- Prader-Willi syndrome- Obesity, Feeding difficulty, Intellectual disabilities, short stature, hypotonia, hypogonadism
- Carpenter syndrome - Obesity, craniosynostosis, polydactyly, syndactyly, Mental retardation
- Alstrom syndrome - Obesity, Progressive loss of vision and hearing, dilated cardiomyopathy, type 2 diabetes, short stature, Cognitive impairment, retinitis pigmentosa, retinal degeneration

Reference: Nelson's 21st/ed page- 1882; Nelson 20th/ed page- 310

Q. 8 years old girl child came to the hospital with signs and symptoms of hypoglycemiA. The patient is a known case of Type I Diabetes Mellitus non-compliance to medication. The target HbA1C required to maintain in this patient is?

A. < 8%
B. < 7.5%
C. < 7%
D. < 6.5%

Answer: B

Solution

HbA1c

- Marker of glycemic control over previous 3months
- Best predictor of long-term complications
- Target levels of HbA1c in children & adolescent → **<7.5%**
- **These levels are falsely low in children with**
  - Sickle cell disease
  - Iron deficiency anemia
  - Increased red cell turn over [like hemolytic anemia]
- **These levels are falsely high in children with**
  - Uremia
  - High dose aspirin treatment

NELSON

- The HbA1c target for all children with diabetes is <7.5%; for those over 18 yr, it is ≤7.0%.

Reference: Ghai, 9th edition, pg-544
NELSON 21E : Pg 3037

78 POISONING IN CHILDREN

POISON

00:00:39

- Any substance (solid/liquid /gas) if introduced into the body/brought in contact can produce harmful effects
- Accidental poisoning is MC
- 1-5 yr age group is affected MC
- Males > females
- MC route: ingestion

Toxidrome 00:03:09

- Toxin+ syndrome
- Refers to recognized poisoning syndromes that are suggestive of toxicity by a particular group of substances.

	Cholinergic toxidrome	Anti-Cholinergic toxidrome
1. Caused by	• OPCS/ carbamates	• Dhatura/ atropine
2. Vital signs	• Bradycardia, normal BP, normal temp	• Tacycardia, hyperthermia, hypertension
3. CNS	• Confusion, coma, fasciculations	• Agitation, psychosis, delirium, seizures
4. Pupils	• Miosis	• Mydriasis
5. Skin	• Diaphoresis	• Dry, hot, flushed
6. Others	• Salivation, lacrimation, diarrhea	• Decreased secretions, thirsty
7. Antidote	• Atropine + pralidoxime	• Physostigmine

CHOLINERGIC TOXIDROME

- D - Diarrhea
- U - Urination
- M - Miosis
- B - Bradycardia
- B - Bronchospasm
- E - Emesis
- L - Lacrimation
- L - Lethargy
- S - Salivation

How to remember

- DUMBBELLS

Anticholinergic toxidrome

- Hot as a hare
- Red as a beet
- Mad as a hatter
- Dry as a bone

When to suspect poisoning? 00:11:33

- Sudden onest
- Cluster of symptoms
- Rapid progression
- Easy access to implicated substance
- High risk child

Principles of management 00:13:01

1. Supportive care: A, B, C
2. Decontamination: Flush the skin, activated charcoal (Not used in kerosene, corrosive poisoning)
3. Specific antidote
   - PCM: N-acetylcysteine
   - BZD: flumazenil
   - Opioid: naloxone
   - Iron overdose: desferoxamine
   - Heparin: protamine
4. Enhanced elimination: Hemodialysis

CORROSIVE POISONING (ACIDS/ALKALIES)

00:17:25

Acid	Alkali
• Coagulative necrosis	• Liquefactive necrosis
• Bad taste& smell	• Odourless, tasteless, viscous
• Superficial gastric injury	• Esophageal injury more than stomach • Transmural/deeper injury

Clinical features

- Burns in oral cavity
- Drooling of saliva
- Dysphagia
- Pain abd. vomiting
- Aspiration pneumonitis
- Perforation: Mediastinitis, peritonitis
- Late features: strictures, carcinoma

Management

- NPO
- Iv fluids
- Inj PPI/H2 blockers
- Upper GI endoscopy:in initial 48 hrs/weeks later on follow up

KEROSENE POISONING

00:22:30

- Supportive treatment
- Gastric lavage, induced vomiting C/I

LEAD POISONING

00:23:05

- **Risk factor:** Non nutritive hand to mouth activity
- Older paints, cosmetics, plastics, toys, batteries
- **Clinical features**
  - GIT: Constipation, anorexia, abd. pain, vomiting
  - CNS: headache, seizures, lethargy, encephalopathy, altered sensorium at >100 microgm/L
  - Renal: Renal tubuar acidosis
  - Hemolytic anemia
  - Peripheral neuropathy
- **Management**
  - Prevention is the key
  - Dietary & behavioural counselling
- Antidotes
  - Oral: DMSA, penicillamine
  - Parenteral: EDTA,BAL
