Paper Question & Answers Detail's

concentration gradient utilizing the energy of another molecule that is moving in the opposite direction is known as;	
A Antiport [T]	
○ B Active transport	
C Bulk flow	
O D Symport	
○ E Uniport	
which of the following is the biologically active form of a drug? A Emollient	
B Elixir	
C Linctus	
O Poultice	
D Poultice E Resin (T)	
0	
A patient with infectious mononucleosis presented to the medical OPD with fever and sore throat. He was prescribed ampicillin for 7 days after confirming that the patient was not allergic to penicillin. 3 days later the patient reported back complaining of rash and itching all over the body. This kind of non allergic rash can be classified as	
A patient with infectious mononucleosis presented to the medical OPD with fever and sore throat. He was prescribed ampicillin for 7 days after confirming that the patient was not allergic to penicillin. 3 days later the patient reported back complaining of rash and itching all over the body. This kind of non allergic rash can be classified as which of the following adverse effects?	
A patient with infectious mononucleosis presented to the medical OPD with fever and sore throat. He was prescribed ampicillin for 7 days after confirming that the patient was not allergic to penicillin. 3 days later the patient reported back complaining of rash and itching all over the body. This kind of non allergic rash can be classified as which of the following adverse effects? A Dependence	
A patient with infectious mononucleosis presented to the medical OPD with fever and sore throat. He was prescribed ampicillin for 7 days after confirming that the patient was not allergic to penicillin. 3 days later the patient reported back complaining of rash and itching all over the body. This kind of non allergic rash can be classified as which of the following adverse effects? A Dependence B Hypersensitivity	

effects. This type of drug-drug interaction is known as;	1
A Competitive antagonism	
B Inverse agonism	
C Neutral antagonism	
D Potentiation [T]	
○ E Summation	
though he is still taking the drug in the same dose as before it is not effective anymore. Which of the following is the most likely responsible for this condition?	(d
A Anaphylaxis	
So a selection of the s	
A Anaphylaxis	
A Anaphylaxis B Dependence	
A Anaphylaxis B Dependence C Resistance	
A Anaphylaxis B Dependence C Resistance D Tachyphylaxis E Tolerance [T] A sedative is to be administered to a patient suffering from insomnia. You have to choose either drug A with an ED50 of 100 and LD50 of 4000, or drug B with an LD50 of 700.	
A Anaphylaxis B Dependence C Resistance D Tachyphylaxis E Tolerance [T] A sedative is to be administered to a patient suffering from insomnia. You have to choose either drug A with an ED50 of 100 and LD50 of 4000, or drug B with an LD50 of 700.	:

You have to choose either drug A with an ED50 of 100 and LD50 of 4000, or drug B with an LD50 of 700. Regarding these two drugs; A A has a narrow therapeutic window	:
A Anaphylaxis B Dependence C Resistance D Tachyphylaxis E Tolerance [T] A sedative is to be administered to a patient suffering from insomnia. You have to choose either drug A with an ED50 of 100 and LD50 of 4000, or drug B with an LD50 of 700. Regarding these two drugs; A A has a narrow therapeutic window B A has a large therapeutic index [T]	:

prescribed to a neonate suffering from jaundice. Which of the following is the most 0 probable reason for administration of phenobarbitone in neonatal Jaundice? A It is an inverse agonist B It is a partial agonist C It is a physical antagonist D It is an enzyme inducer (T) E It is an enzyme inhibitor A dosage of tablet phenytoin was given to a patient suffering from epilepsy. A constant 1 amount of this drug is eliminated per unit time. Regarding the elimination of phenytoin; A Elimination depends on the drug concentration B Elimination remains constant [T] C Excretion increases with the increasing dose D Half life decreases with increasing the dose E The half-life remains constant A patient presented to the medical OPD with the diagnosis of malaria. Chloroquine was administered as 4 tablets stat, 2 tablets after 6 hours and then 1 tablet BD for 2 1 days. Which of the following is the most likely reason of giving 4 tablets stat initially? A Chloroquine gets quickly redistributed B Chloroquine has a high clearance rate C Chloroquine has a short half life D The patient is in a state of medical emergency E The volume of distribution of chloroquine is high

E The volume of distribution of chloroquine is high A 35-year-old North American man complained to his physician of tingling sensation in his limbs and noted that his arms sometime felt heavy. The man recently diagnosed with pulmonary tuberculosis, had 1 been receiving isoniazid and rifampin for 2 months. He was diagnosed with peripheral neuropathy, a known adverse effect of isoniazid. Which of the following events most likely caused the patient's symptoms and signs? A Allergic reaction to isoniazid B Allergic reaction to rifampin C Inherited deficiency of N-acetyltransferase [T] D Rifampin-induced inhibition of isoniazid metabolism E Worsening of the disease, despite the therapy A 59-year-old Asian man with atrial fibrillation presented to his physician complaining of red urine. The man had been receiving a standard dose of warfarin, which 1 is an anticoagulant drug biotransformed by CYP2C9 isozyme. Which of the following was the most likely cause of the patient's disorder? A Decreased metabolism of CYP2C9 B Decreased renal excretion of warfarin C Genetic polymorphism of CYP2C9 [T] D Increased CYP2C9 synthesis in a person of Asian origin. E Increased protein binding of warfarin

acetaminophen in aqueous solution to treat a severe headache. Two hours later, the pain was not diminished. Because acetaminophen 1 should be effective in about 30 minutes after its oral administration, which of the following conditions most likely delayed the oral absorption of the drug in this patient? A A large volume of distribution of the drug B A very low clearance of the drug C Increase in the plasma half life of the drug D The administration of the drug in aqueous solution E The decrease in the intestinal peristalsis [T] A 69-year- old woman was brought to a local hospital emergency department by her son, who reported that his mother was found lethargic, disoriented, and combative a few hours earlier. Additional history revealed that she had ingested a large number of aspirin tablets in a suicide attempt. An 0 appropriate therapy was instituted, which included the administration of sodium bicarbonate to increase the elimination of salicylate. Which of the following best explains the mechanism of this increased elimination? A Decreased tubular active transport of salicylate B Decreased renal biotransformation of salicylate C Decreased bioavailability of salicylate D Increased glomerular filtration of salicylate E Urinary ion trapping of salicylate [T]

A 51-year old woman suffering from

hyperthyroidism was administered an oral

A 30- year old woman took a large dose of

solution of radioactive iodine to destroy her thyroid gland. Which of the following 1 permeation processes most likely accounted for the transfer of the drug across the thyroid cell membrane? A Active transport [T] B Aqueous diffusion C Endocytosis D Facilitated diffusion E Lipid diffusion Thiopental is fat soluble drug, hence it is redistributed from the brain to the fat tissues after administration. This property 0 is most likely responsible for which of the following? A Increased toxicity B Prolonged action C Prolonged half life D Quick clearance E Short action (T) A patient presented to Northwest General hospital with rigors chills and fever for last 3 days and was diagnosed with malaria. He was prescribed with a loading dose of 4 1 tablets of choloroquine. The loading dose of a choloroquine is usually based on which of the following? A Apparent volume of distribution [T] B Area under the curve (AUC) C Fraction of drug excreted unchanged in the urine D Percentage of drug bound to plasma proteins

E 20 hours A 6-year-old boy suffering from influenza received an anti-pyretic drug for 4 days. On the fifth day, he lapsed into a coma and died. The autopsy disclosed diffuse 0 microvescicular fatty infiltration of the liver, heart, and kidneys, as w ell as cerebral edema. Which of the following antipyretics most likely caused the patient's death? A Acetaminophen B Aspirin [T] C Ibuprofen D Indomethacin E Piroxicam A 59-year-old obese woman presented to the emergency department because of severe colicky pain in the right lumbar region. The patient had a long history of osteoarthritis for which she had been taking several different pain killers daily for the past year. Current medications included 0 atorvastatin and ezetimibe for hyperlipidemia and hydrochlorothiazide for mild hypertension. A renal biopsy confirmed the diagnosis of papillary necrosis and tubulointerstitial inflammation of the kidney. Which of the following drugs most likely caused the patient's disease? A Atorvastatin B Celecoxib C Diclofenac [T] D Hydrochlorothiazide E Tramadol

A 65-year-old man had been recently diagnosed with osteoarthritis. Six months

0

A Celecoxib [T]

B Ibuprofen

C Indomethacin

D Ketorolac

E Piroxicam

A female of 30 years was receiving a drug for the treatment of malaria. A few weeks later she presented to medical OPD with blurred vision. Ophthalmoscopic examination revealed retinal damage. Which of the following drugs is most probably responsible for this adverse effect?

1

A Amodiaquine

B Artemisinin

C Chloroquine [T]

D Mefloquine

E Primaquine

A male of 25 years presented to medical emergency with chills and rigors. The lab investigations confirmed the diagnosis of malaria and treatment was given. A few months later he again presented with malaria which was considered to be a reactivation of a dormant form of vivax malaria. Which of the following drugs should be used for the treatment of malaria in this patient?

1

A Atovaquone

B Chloroquine

severe pharyngitis that turned out to be due to Streptococcus pyogenes. Past history of the patient was significant for an anaphylactic reaction to ampicillin. Which of the following antibiotics would be most appropriate for this patient?

1

A Ceftriaxone	
○ B Ceftazidime	
C Imipenem	
D Erythromycin (T)	
○ E Aztreonam	

A 53-year-old man was admitted to the hospital with the admitting diagnosis of pneumonia. Further exams indicated that the pneumonia was due to Mycoplasma pneumonia, and treatment with an appropriate bacteriostatic antibiotic was started. The given drug most likely belonged to which of the following classes?

1

A Cephalosporins	
B Aminoglycosides	
C Macrolides [T]	
D Carbapenems	
○ E Fluoroqinolones	

A 65-year-old man complained to his physician of nervousness, insomnia, and palpitations. The man had been suffering from chronic obstructive pulmonary disease for several years and had been receiving therapy that included theophylline. A few days earlier, he had been diagnosed with streptococcal pharyngitis and started an appropriate treatment. The physician thought that the patient's symptoms were most likely due to an antibiotic—theophylline interaction. Which of the following antibiotics was most likely responsible for

1

0	A Penicillin G	
0	B Streptomycin	
0	C Doxycycline	
	D Erythromycin [T]	
0	E Rifampin	
esion batch mucos broad befor Which	laints of oral discharge and white is. The examination reveals whitish wes over the tongue and the oral isa. The patient reports of taking a il spectrum antibiotic for 2 months we the appearance of these lesions. In of the following is the most opriate drug for the treatment of this int?	7
0	A Amphotericin B	
0		
000	A Amphotericin B	
0 0 0	A Amphotericin B B Erythromycin

Select the sulfonamide drug which is active against Pseudomonas and is used by topical 1 application for prophylaxis of infection in burn cases: A Silver sulfadiazine (T) B Sulfadiazine C Sulfadoxine D Sulfamethoxazole E Trimethoprim An antifungal drug that binds to ergosterol forming "pores" that disrupt fungal 1 membrane integrity is; A Amphotericin B [T] B Caspofungin C Fluconazole D Flucytosine E Terbinafine A patient suffering from a respiratory tract infection was started on a broad spectrum antibiotic. A few days later he presented with severe abdominal pain and 1 gastrointestinal distress. Examination revealed pseudomembranes and treatment was initiated wit Vancomycin. Which of the following drugs is the most likely cause of this condition? A Amoxicillin [T] B Aztreonam C Benzyl Penicillin D Imipenem E Linezolid

A male of 25 years presented to medical emergency with chills and rigors. The lab

investigations confirmed the diagnosis of malaria and treatment was given. A few months later he again presented with 1 malaria which was considered to be a reactivation of a dormant form. Which of the following drugs should be used for the radical cure of the disease? A Atovaquone B Chloroquine C Lumefantrine D Primaquine (T) E Quinine The duration of action of Benzathine Penicillin is longer as compared to Penicillin even though both share similar pharmacological characteristics. Which of 0 the following is the reason for the prolongation of action of benzathine Penicillin? A Addition of beta lactamase inhibitor B Addition of probenecid C Decreased renal tubular secretion D Increased sensitivity of the receptor E Side chain substitution (T) A female of 30 years was receiving a drug for the treatment of malaria. A few weeks later she presented to medical OPD with 1 blurred vision. Opthamlmoscopic examination revealed retinal damage. Which of the following drugs is most probably responsible for this adverse effect? A Amodiaquine B Artemesnin

C Chloroquine [T]

emergency with chills and rigors. The lab

D Mefloquine E Primaquine	
A male of 25 years presented to medical emergency with chills and rigors. The lab investigations confirmed the diagnosis of malaria and treatment was given. A few months later he again presented with malaria which was considered to be a reactivation of a dormant form. Which of the following drugs should be used for the radical cure of the disease?	1
A Atovaquone	
○ B Chloroquine	
C Lumefantrine	
D Primaquine [T]	
○ E Quinine	
which of the following along acting via blue	
Which of the following drugs acting via DNA gyrase inhibition and would be the drug of choice for gram negative uncomplicated urinary tract infection?	1
gyrase inhibition and would be the drug of choice for gram negative uncomplicated	1
gyrase inhibition and would be the drug of choice for gram negative uncomplicated urinary tract infection?	1
gyrase inhibition and would be the drug of choice for gram negative uncomplicated urinary tract infection? A Benzyl Penicillin	1
gyrase inhibition and would be the drug of choice for gram negative uncomplicated urinary tract infection? A Benzyl Penicillin B Cefepime	1
gyrase inhibition and would be the drug of choice for gram negative uncomplicated urinary tract infection? A Benzyl Penicillin B Cefepime C Ciprofloxacin [T]	1

A Antioxidants [T]	
○ B Analgesics	
C Antimicrobials	
O Antineoplastic agents	
○ E Glucocorticoids	
At autopsy, the heart of a 63 year old man weighs only 250gm (normal 330gm) and has small right and left ventricles. The myocardium has dark chocolate-brown color throughout which on histologic examination reveal yellow brown paranuclear pigment. Which of the following pigments is described in this scenario?	
A Bilirubin	
☐ B Glycogen	
B Glycogen C Hemosiderin	
C Hemosiderin	
C Hemosiderin D Lipofuscin [T]	
C Hemosiderin D Lipofuscin [T] E Melanin A 22 year old woman with leukemia undergoes bone marrow transplantation and receives a partially mismatched donor marrow. One month later she has a scaling skin rash. A skin biopsy is obtained which shows morphological findings of graft versus host disease. This most likely results	
C Hemosiderin D Lipofuscin (T) E Melanin A 22 year old woman with leukemia undergoes bone marrow transplantation and receives a partially mismatched donor marrow. One month later she has a scaling skin rash. A skin biopsy is obtained which shows morphological findings of graft versus host disease. This most likely results from which of the following reactions?	
C Hemosiderin D Lipofuscin [T] E Melanin A 22 year old woman with leukemia undergoes bone marrow transplantation and receives a partially mismatched donor marrow. One month later she has a scaling skin rash. A skin biopsy is obtained which shows morphological findings of graft versus host disease. This most likely results from which of the following reactions? A Activation of caspases [T]	

episode of chest pain for 6 hours. Histologic section of his left ventricular myocardium shows irreversibly damaged cardiac myocytes with coagulative type necrosis. Which of the following conditions most likely produced these myocardial changes?	
A Arterial thrombosis [T]	
B Autoimmunity	
C Blunt chest trauma	
D Protein deficient diet	
○ E Viral infection	
A Apoptosis	
523 87 S

A Apoptosis B Conjugation C Necrosis D Transduction (T) E Transformation A house officer collects sputum from a patient. The doctor is suspecting tuberculosis, on which medium is he going to culture it to confirm the diagnosis? A Agar B broth	

A patient comes to A & E with history of wound contaminated with soil. At the moment he is having spastic paralysis, doctor is sure that the patient has tetanus 1 and gives a tetanus toxoid vaccine and pre formed antibodies. What sort of immunity is this? A Active immunity B adaptive immunity C Active passive immunity [T] D Innate immunity E passive immunity Pathogenesis refers to the sequence of events during the course of an infection within the host, and the mechanisms giving 1 rise to these events. Which of the following choices lists the steps of pathogenesis in the correct order? A adhesion, exposure, infection, invasion B disease, infection, exposure, invasion C exposure, adhesion, invasion, infection [T] D infection, invasion, adhesion, exposure E invasion, infection, adhesion, exposure A 65 year old women presents with 3 months history of transient ischemic attacks. She has an audible bruit on auscultation of the neck. A left carotid endarterectomy is performed. Grossly the atheromatous plaque 0 has yellow-tan and firm appearance. Which of the following material will be found in abundance in the form of crystals within cleft like spaces if you examine the

specimen microscopically?

	A Cholesterol [T]
	B Glycogen
	C Hemosiderin
	O Immunoglobulin
7	Several bacteria that form spores are important human pathogens. Which one of the following is the most accurate statement about bacterial spores?
Ì	A They are killed by boiling for 15 minutes.
	B They are produced primarily by gram-negative cocci.
	C They are formed primarily when the bacterium is exposed to antibiotics.
	D They are produced by anaerobes only in the presence of oxygen
	E They are metabolically inactive, yet can survive fo
	years in that inactive state. [T]
7	In a rapidly multiplying bacterial population, cell numbers increase exponentially. This phase of the growth cycle is referred to as which phase;
3	In a rapidly multiplying bacterial population, cell numbers increase exponentially. This phase of the growth cycle is referred to as
7	In a rapidly multiplying bacterial population, cell numbers increase exponentially. This phase of the growth cycle is referred to as which phase;
7	In a rapidly multiplying bacterial population, cell numbers increase exponentially. This phase of the growth cycle is referred to as which phase; A lag phase
,	In a rapidly multiplying bacterial population, cell numbers increase exponentially. This phase of the growth cycle is referred to as which phase; A lag phase B stationary phase

is the approximate diameter of the bacteria cell?	l
A 16 μm	
B 8 µm	
C 4 µm	
D 2 μm	
E 0.5 to 1.0 μm [T]	
A diabetic lady comes to hospital with history of repeated boils on the body. Using your knowledge of microbiology, which microorganism is involved?	
A Bacillus	
A Bacillus B Corynebacterium	
B Corynebacterium	
B Corynebacterium C Cyanobacteria	
B Corynebacterium C Cyanobacteria D Staph.aureus [T]	
B Corynebacterium C Cyanobacteria D Staph.aureus [T] E Strept.pneumoniae A 30 year old man who works in an abattoir comes to the doctor wit fever on and off. The doctor diagnosed him as having zoonotic infection Brucella. Which type of rod is	
B Corynebacterium C Cyanobacteria D Staph.aureus [T] E Strept.pneumoniae A 30 year old man who works in an abattoir comes to the doctor wit fever on and off. The doctor diagnosed him as having zoonotic infection Brucella. Which type of rod is Brucella?	
B Corynebacterium C Cyanobacteria D Staph.aureus [T] E Strept.pneumoniae A 30 year old man who works in an abattoir comes to the doctor wit fever on and off. The doctor diagnosed him as having zoonotic infection Brucella. Which type of rod is Brucella? A Giemsa positive

which moved with swallowing. She was diagnosed with a multinodular goiter. The attending surgeon listed her for total thyroidectomy. After the procedure, the patient developed inspiratory stridor in the recovery room and was not maintaining oxygen saturation. Examination revealed both vocal cords in paramedian position. The complication that has occurred during surgery is:

1

	A Bilateral abductor paralysis (T)	
\bigcirc	B hypocalcemia	
\circ	C laryngeal spasm	
\circ	D tension hematoma	
0	E tracheomalacia	

A 30 years old male was involved in a road traffic accident 2 days back. He received trauma to his right temporal bone and was complaining of pain from the impact. He has now presented with the complaints of decreased hearing on the right side. O/E, tympanic membrane is intact, tuning fork testes show right conductive hearing loss. His PTA shows 50 db of conductive deafness. Which of the following mechanisms has been disrupted, resulting in his hearing loss

0

distributed, resoluting in his hearing	1055
A endolymphatic pressure	
B eustachian tube obstructio	n
C impedance matching	
D lateral semicircular canal	
E lever action of ossicles (T]

A 15 years old female presented to opd with the complaints of right ear discharge fom the last 4 years. She now presented with episodes of vomiting and sensations of head spinning (vertigo) from the last 2 days. 0/E patient had a right central perforation in the tympanic membrane with mucopus 1 coming out through the perforation. She also had nystagmus with the fast component towards the right ear and she could not maintain balance. Based on these findings, which structure has been involved by the disease in the middle ear A facial nerve B lateral semicircular canal [T] C ossicular chain D promontary E stapes footplate A 60-year-old patient comes to Eye OPD with chief complaints of gradual decrease vision for last 1 year. The visual deterioration is painless and progressive. It is not associated 1 with any history of flashes of light, floaters or trauma. On examination, you noticed opacification of the lens. What is the most likely diagnosis? A A. Corneal ulcer B Age-related cataract [T] C Retinal detachment D corneal ulcer E Varatacanus

E lever action of ossicles [T]

	○ E Keratoconus	
	A 2-month-old baby is brought by her parents with complaints of watering and discharge from her eyes since 1 month. Which statement regarding congenital Nasolacrimal duct obstruction is true?	0
0	A Noncanalization at the lower end of the nasolacrimal duct is the usual cause [T]
